

Universal Serial Bus Type-C Cable and Connector Specification

Revision Release 1.23
March 25, 2016 July 14, 2017

**Copyright © 2014-2017, USB 3.0 Promoter Group:
Apple Inc., Hewlett-Packard Inc., Intel Corporation, Microsoft
Corporation, Renesas, STMicroelectronics, and Texas Instruments
All rights reserved.**

NOTE: Adopters may only use the USB Type-C™ cable and connector to implement USB or third party functionality as expressly described in this Specification; all other uses are prohibited.

LIMITED COPYRIGHT LICENSE: The USB 3.0 Promoters grant a conditional copyright license under the copyrights embodied in the USB Type-C Cable and Connector Specification to use and reproduce the Specification for the sole purpose of, and solely to the extent necessary for, evaluating whether to implement the Specification in products that would comply with the specification. Without limiting the foregoing, use of the Specification for the purpose of filing or modifying any patent application to target the Specification or USB compliant products is not authorized. Except for this express copyright license, no other rights or licenses are granted, including without limitation any patent licenses. In order to obtain any additional intellectual property licenses or licensing commitments associated with the Specification a party must execute the USB 3.0 Adopters Agreement. NOTE: By using the Specification, you accept these license terms on your own behalf and, in the case where you are doing this as an employee, on behalf of your employer.

INTELLECTUAL PROPERTY DISCLAIMER

THIS SPECIFICATION IS PROVIDED TO YOU "AS IS" WITH NO WARRANTIES WHATSOEVER, INCLUDING ANY WARRANTY OF MERCHANTABILITY, NON-INFRINGEMENT, OR FITNESS FOR ANY PARTICULAR PURPOSE. THE AUTHORS OF THIS SPECIFICATION DISCLAIM ALL LIABILITY, INCLUDING LIABILITY FOR INFRINGEMENT OF ANY PROPRIETARY RIGHTS, RELATING TO USE OR IMPLEMENTATION OF INFORMATION IN THIS SPECIFICATION. THE PROVISION OF THIS SPECIFICATION TO YOU DOES NOT PROVIDE YOU WITH ANY LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS.

All implementation examples and reference designs contained within this Specification are included as part of the limited patent license for those companies that execute the USB 3.0 Adopters Agreement.

USB Type-C™ and USB-C™ are trademarks of the Universal Serial Bus Implementers Forum (USB-IF). All product names are trademarks, registered trademarks, or service marks of their respective owners.

Pre-Release Draft Industry Reviewing Companies That Provided Feedback	14	
Revision History.....	14	
1	Introduction	15
1.1	Purpose.....	15
1.2	Scope	15
1.3	Related Documents.....	16
1.4	Conventions	16
1.4.1	Precedence.....	16
1.4.2	Keywords	16
1.4.3	Numbering	17
1.5	Terms and Abbreviations.....	17
2	Overview	21
2.1	Introduction	21
2.2	USB Type-C Receptacles, Plugs and Cables	22
2.3	Configuration Process.....	23
2.3.1	Source-to-Sink Attach/Detach Detection.....	24
2.3.2	Plug Orientation/Cable Twist Detection.....	24
2.3.3	Initial Power (Source-to-Sink) Detection and Establishing the Data (Host-to-Device) Relationship	24
2.3.4	USB Type-C VBUS Current Detection and Usage	25
2.3.5	USB PD Communication.....	25
2.3.6	Functional Extensions.....	26
2.4	VBUS.....	26
2.5	VCONN.....	27
2.6	Hubs.....	27
3	Mechanical.....	28
3.1	Overview	28
3.1.1	Compliant Connectors.....	28
3.1.2	Compliant Cable Assemblies	28
3.1.3	Compliant USB Type-C to Legacy Cable Assemblies	28
3.1.4	Compliant USB Type-C to Legacy Adapter Assemblies	29
3.2	USB Type-C Connector Mating Interfaces.....	29
3.2.1	Interface Definition	29
3.2.2	Reference Designs.....	54
3.2.3	Pin Assignments and Descriptions	61
3.3	Cable Construction and Wire Assignments	62
3.3.1	Cable Construction (Informative).....	62
3.3.2	Wire Assignments	64
3.3.3	Wire Gauges and Cable Diameters (Informative)	65

3.4	Standard USB Type-C Cable Assemblies	67
3.4.1	USB Full-Featured Type-C Cable Assembly	67
3.4.2	USB 2.0 Type-C Cable Assembly	68
3.4.3	USB Type-C Captive Cable Assemblies	69
3.5	Legacy Cable Assemblies.....	69
3.5.1	USB Type-C to <i>USB 3.1 Standard-A</i> Cable Assembly	70
3.5.2	USB Type-C to <i>USB 2.0 Standard-A</i> Cable Assembly	71
3.5.3	USB Type-C to <i>USB 3.1 Standard-B</i> Cable Assembly	72
3.5.4	USB Type-C to <i>USB 2.0 Standard-B</i> Cable Assembly	73
3.5.5	USB Type-C to <i>USB 2.0 Mini-B</i> Cable Assembly	74
3.5.6	USB Type-C to <i>USB 3.1 Micro-B</i> Cable Assembly.....	75
3.5.7	USB Type-C to <i>USB 2.0 Micro-B</i> Cable Assembly.....	77
3.6	Legacy Adapter Assemblies	78
3.6.1	USB Type-C to <i>USB 3.1 Standard-A</i> Receptacle Adapter Assembly	78
3.6.2	USB Type-C to <i>USB 2.0 Micro-B</i> Receptacle Adapter Assembly	80
3.7	Electrical Characteristics	81
3.7.1	Raw Cable (Informative)	81
3.7.2	USB Type-C to Type-C Passive Cable Assemblies (Normative).....	82
3.7.3	Mated Connector (Informative)	95
3.7.4	USB Type-C to Legacy Cable Assemblies (Normative)	99
3.7.5	USB Type-C to USB Legacy Adapter Assemblies (Normative).....	103
3.7.6	Shielding Effectiveness Requirements (Normative)	105
3.7.7	DC Electrical Requirements (Normative)	109
3.8	Mechanical and Environmental Requirements (Normative)	112
3.8.1	Mechanical Requirements.....	112
3.8.2	Environmental Requirements.....	118
3.9	Docking Applications (Informative)	119
3.10	Implementation Notes and Design Guides	120
3.10.1	EMC Management (Informative)	120
3.10.2	Stacked and Side-by-Side Connector Physical Spacing (Informative).....	123
3.10.3	Cable Mating Considerations (Informative)	123
4	Functional.....	125
4.1	Signal Summary	125
4.2	Signal Pin Descriptions.....	125
4.2.1	SuperSpeed USB Pins	125
4.2.2	USB 2.0 Pins.....	126
4.2.3	Auxiliary Signal Pins	126
4.2.4	Power and Ground Pins	126
4.2.5	Configuration Pins	126
4.3	Sideband Use (SBU)	126
4.4	Power and Ground	126
4.4.1	IR Drop.....	126
4.4.2	VBUS.....	127

4.4.3	VCONN.....	129
4.5	Configuration Channel (CC).....	134
4.5.1	Architectural Overview	134
4.5.2	CC Functional and Behavioral Requirements	148
4.5.3	USB Port Interoperability Behavior	174
4.6	Power	186
4.6.1	Power Requirements during USB Suspend	187
4.6.2	VBUS Power Provided Over a USB Type-C Cable	188
4.7	USB Hubs	191
4.8	Power Sourcing and Charging.....	192
4.8.1	DFP as a Power Source	192
4.8.2	Non-USB Charging Methods	195
4.8.3	Sinking Host	195
4.8.4	Sourcing Device	196
4.8.5	Charging a System with a Dead Battery	196
4.8.6	USB Type-C Multi-Port Chargers.....	196
4.9	Electronically Marked Cables	198
4.9.1	Parameter Values	200
4.9.2	Active Cables	200
4.10	VCONN-Powered Accessories (VPAs) and VCONN-Powered USB Devices (VPDs)	200
4.10.1	VCONN-Powered Accessories (VPAs)	200
4.10.2	VCONN-Powered USB Devices (VPDs)	201
4.11	Parameter Values	201
4.11.1	Termination Parameters	201
4.11.2	Timing Parameters	203
4.11.3	Voltage Parameters	206
5	Functional Extensions	208
5.1	Alternate Modes	208
5.1.1	Alternate Mode Architecture	208
5.1.2	Alternate Mode Requirements.....	208
5.1.3	Parameter Values	213
5.1.4	Example Alternate Mode – USB DisplayPort™ Dock	213
5.2	Managed Active Cables	216
5.2.1	Requirements for Managed Active Cables that respond to SOP' and SOP"	216
5.2.2	Cable Message Structure	218
5.2.3	Modal Cable Management	218
A	Audio Adapter Accessory Mode	219
A.1	Overview	219
A.2	Detail	219
A.3	Electrical Requirements.....	220
A.4	Example Implementations	222

A.4.1	Passive 3.5 mm to USB Type-C Adapter – Single Pole Detection Switch.....	222
A.4.2	3.5 mm to USB Type-C Adapter Supporting 500 mA Charge-Through	222
B	Debug Accessory Mode.....	224
B.1	Overview	224
B.2	Functional	224
B.2.1	Signal Summary.....	225
B.2.2	Port Interoperability.....	225
B.2.3	Debug Accessory Mode Entry	225
B.2.4	Connection State Diagrams	226
B.2.5	DTS Port Interoperability Behavior	235
B.2.6	Orientation Detection	244
B.3	Security/Privacy Requirements:.....	245
C	USB Type-C Digital Audio	246
C.1	Overview	246
C.2	USB Type-C Digital Audio Specifications	246

Revision History

Revision	Date	Description
1.0	August 11, 2014	Initial Release
1.1	April 3, 2015	Reprint release including incorporation of all approved ECNs as of the revision date plus editorial clean-up.
1.2	March 25, 2016	Reprint release including incorporation of all approved ECNs as of the revision date plus editorial clean-up.
<u>1.3</u>	<u>July 14, 2017</u>	<u>Reprint release including incorporation of all approved ECNs as of the revision date plus editorial clean-up.</u>

1 Introduction

With the continued success of the USB interface, there exists a need to adapt USB technology to serve newer computing platforms and devices as they trend toward smaller, thinner and lighter form-factors. Many of these newer platforms and devices are reaching a point where existing USB receptacles and plugs are inhibiting innovation, especially given the relatively large size and internal volume constraints of the Standard-A and Standard-B versions of USB connectors. Additionally, as platform usage models have evolved, usability and robustness requirements have advanced and the existing set of USB connectors were not originally designed for some of these newer requirements. This specification is to establish a new USB connector ecosystem that addresses the evolving needs of platforms and devices while retaining all of the functional benefits of USB that form the basis for this most popular of computing device interconnects.

1.1 Purpose

This specification defines the USB Type-C™ receptacles, plug and cables.

The USB Type-C Cable and Connector Specification is guided by the following principles:

- Enable new and exciting host and device form-factors where size, industrial design and style are important parameters
- Work seamlessly with existing USB host and device silicon solutions
- Enhance ease of use for connecting USB devices with a focus on minimizing user confusion for plug and cable orientation

The USB Type-C Cable and Connector Specification defines a new receptacle, plug, cable and detection mechanisms that are compatible with existing USB interface electrical and functional specifications. This specification covers the following aspects that are needed to produce and use this new USB cable/connector solution in newer platforms and devices, and that interoperate with existing platforms and devices:

- USB Type-C receptacles, including electro-mechanical definition and performance requirements
- USB Type-C plugs and cable assemblies, including electro-mechanical definition and performance requirements
- USB Type-C to legacy cable assemblies and adapters
- USB Type-C-based device detection and interface configuration, including support for legacy connections
- USB Power Delivery optimized for the USB Type-C connector

The USB Type-C Cable and Connector Specification defines a standardized mechanism that supports Alternate Modes, such as repurposing the connector for docking-specific applications.

1.2 Scope

This specification is intended as a supplement to the existing [USB 2.0](#), [USB 3.1](#) and [USB Power Delivery](#) specifications. It addresses only the elements required to implement and support the USB Type-C receptacles, plugs and cables.

Normative information is provided to allow interoperability of components designed to this specification. Informative information, when provided, may illustrate possible design implementations.

1.4 Conventions

1.4.1 Precedence

If there is a conflict between text, figures, and tables, the precedence shall be tables, figures, and then text.

1.4.2 Keywords

The following keywords differentiate between the levels of requirements and options.

1.4.2.1 Informative

Informative is a keyword that describes information with this specification that intends to discuss and clarify requirements and features as opposed to mandating them.

1.4.2.2 May

May is a keyword that indicates a choice with no implied preference.

1.4.2.3 N/A

N/A is a keyword that indicates that a field or value is not applicable and has no defined value and shall not be checked or used by the recipient.

1.4.2.4 Normative

Normative is a keyword that describes features that are mandated by this specification.

1.4.2.5 Optional

Optional is a keyword that describes features not mandated by this specification. However, if an optional feature is implemented, the feature shall be implemented as defined by this specification (optional normative).

1.4.2.6 Reserved

Reserved is a keyword indicating reserved bits, bytes, words, fields, and code values that are set-aside for future standardization. Their use and interpretation may be specified by future extensions to this specification and, unless otherwise stated, shall not be utilized or adapted by vendor implementation. A reserved bit, byte, word, or field shall be set to zero by the sender and shall be ignored by the receiver. Reserved field values shall not be sent by the sender and, if received, shall be ignored by the receiver.

1.4.2.7 Shall

Shall is a keyword indicating a mandatory (normative) requirement. Designers are mandated to implement all such requirements to ensure interoperability with other compliant Devices.

1.4.2.8 Should

Should is a keyword indicating flexibility of choice with a preferred alternative. Equivalent to the phrase "it is recommended that".

1.4.3 Numbering

Numbers that are immediately followed by a lowercase "b" (e.g., 01b) are binary values. Numbers that are immediately followed by an uppercase "B" are byte values. Numbers that are immediately followed by a lowercase "h" (e.g., 3Ah) are hexadecimal values. Numbers not immediately followed by either a "b", "B", or "h" are decimal values.

1.5 Terms and Abbreviations

Term	Description
Accessory Mode	A reconfiguration of the connector based on the presence of Rd/Rd or Ra/Ra on CC1/CC2, respectively.
Active cable	An Electronically Marked Cable with additional electronics to condition the data path signals.
Alternate Mode	Operation defined by a vendor or standards organization that is associated with a SVID assigned by the USB-IF. Entry and exit into and from an Alternate Mode is controlled by the USB PD Structured VDM Enter Mode and Exit Mode commands.
Alternate Mode Adapter (AMA)	A USB PD Device which supports Alternate Modes and acts as a UFP.
Audio Adapter Accessory Mode	The Accessory Mode defined by the presence of Ra/Ra on CC1/CC2, respectively. See Appendix A.
BFSK	Binary Frequency Shift Keying used for USB PD communication over VBUS.
BMC	Biphase Mark Coding used for USB PD communication over the CC wire.
Captive cable	A cable that is terminated on one end with a USB Type-C plug and has a vendor-specific connect means (hardwired or custom detachable) on the opposite end.
CC	Configuration Channel (CC) used in the discovery, configuration and management of connections across a USB Type-C cable.

Term	Description
Debug Accessory Mode (DAM)	The Accessory Mode defined by the presence of Rd/Rd or Rp/Rp on CC1/CC2, respectively. See Appendix B.
Debug and Test System (DTS)	The combined hardware and software system that provides a system developer debug visibility and control when connected to a Target System in Debug Accessory Mode.
Default VBUS	VBUS voltage as defined by the USB 2.0 and USB 3.1 specifications. Note: where used, 5 V connotes the same meaning.
DFP	Downstream Facing Port, specifically associated with the flow of data in a USB connection. Typically the ports on a host or the ports on a hub to which devices are connected. In its initial state, the DFP sources VBUS and VCONN, and supports data. A charge-only DFP port only sources VBUS.
Direct connect device	The host's DFP is connected directly to a device with no USB hub in between, either via a captive cable or without just a USB Type-C plug (e.g., thumb drive), to the device's UFP.
DRD (Dual-Role-Data)	The acronym used in this specification to refer to a USB port that can operate as either a DFP (Host) or UFP (Device). The role that the port initially takes is determined by the port's power role at attach. A Source port takes on the data role of a DFP and a Sink port takes on the data role of a UFP. The port's data role may be changed dynamically using USB PD Data Role Swap.
DRP (Dual-Role-Power)	The acronym used in this specification to refer to a USB port that can operate as either a Source or a Sink. The role that the port offers may be fixed to either a Source or Sink or may alternate between the two port states. Initially when operating as a Source, the port will also take on the data role of a DFP and when operating as a Sink, the port will also take on the data role of a UFP. The port's power role may be changed dynamically using USB PD Power Role Swap.
DR_Swap	USB PD Data Role Swap.
Electronically Marked Cable	A USB Type-C cable that uses USB PD to provide the cable's characteristics.
eMarker	The element in an Electronically Marked Cable that returns information about the cable in response to a USB PD Discover Identity command.
Initiator	The port initiating a Vendor Defined Message. It is independent of the port's PD role (e.g., Provider, Consumer, Provider/Consumer, or Consumer/Provider). In most cases, the Initiator will be a host.
Passive cable	A cable that does not incorporate any electronics to condition the data path signals. A passive cable may or may not be electronically marked.
Port Partner	Refers to the port (device or host) a port is attached to.
Power Bank	A device with a battery whose primary function is to charge or otherwise extend the runtime of other USB Type-C devices.

Term	Description
Powered cable	A cable with electronics in the plug that requires VCONN indicated by the presence of Ra between the VCONN pin and ground.
PR_Swap	USB PD Power Role Swap.
Responder	The port responding to the Initiator of a Vendor Defined Message (VDM). It is independent of the port's PD role (e.g., Provider, Consumer, Provider/Consumer, or Consumer/Provider). In most cases, the Responder will be a device.
SBU	Sideband Use.
SID	A Standard ID (SID) is a unique 16-bit value assigned by the USB-IF to identify an industry standard.
Sink	Port asserting Rd on CC and when attached is consuming power from VBUS; most commonly a Device.
Source	Port asserting Rp on CC and when attached is providing power over VBUS; most commonly a Host or Hub DFP.
SVID	General reference to either a SID or a VID. Used by USB PD Structured VDMs when requesting SIDs and VIDs from a device.
Target System (TS)	The system being debugged in Debug Accessory Mode.
Type-A	A general reference to all versions of USB "A" plugs and receptacles.
Type-B	A general reference to all versions of USB "B" plugs and receptacles.
Type-C Plug	A USB plug conforming to the mechanical and electrical requirements in this specification.
Type-C Port	The USB port associated to a USB Type-C receptacle. This includes the USB signaling, CC logic, multiplexers and other associated logic.
Type-C Receptacle	A USB receptacle conforming to the mechanical and electrical requirements of this specification.
UFP	Upstream Facing Port, specifically associated with the flow of data in a USB connection. The port on a device or a hub that connects to a host or the DFP of a hub. In its initial state, the UFP sinks VBUS and supports data.
USB 2.0 Type-C Cable	A USB Type-C to Type-C cable that only supports USB 2.0 data operation. This cable does not include USB 3.1 or SBU wires.
USB 2.0 Type-C Plug	A USB Type-C plug specifically designed to implement the USB 2.0 Type-C cable.
USB Full-Featured Type-C Cable	A USB Type-C to Type-C cable that supports USB 2.0 and USB 3.1 data operation. This cable includes SBU wires.
USB Full-Featured Type-C Plug	A USB Type-C plug specifically designed to implement the USB Full-Featured Type-C cable.
USB Safe State	The USB Safe State as defined by the USB PD specification.
VPD charge-through	A mechanism for a VCONN-Powered USB Device to pass power and CC communication from one port to the other without any reregulation. This will be defined in a future specification.

Term	Description
<u>VCONN-Powered Accessory</u> <u>VCONN-powered accessory (VPA)</u>	An accessory that is powered from VCONN to operate in an Alternate Mode. <u>VPAs cannot implement the charge-through mechanism described for VPDs, and instead must intermediate by negotiating USB Power Delivery with both the connected host and source in order to enable similar functionality.</u>
<u>VCONN-Powered USB Device (VPD)</u>	<u>A USB direct-connect or captive-cable device that can be powered solely from either VCONN or VBUS. VPDs may optionally support the VPD charge-through capability.</u>
VCONN_Swap	<u>USB PD</u> VCONN Swap.
VDM	Vendor Defined Message as defined by the <u>USB PD</u> specification.
VID	A Vendor ID (VID) is a unique 16-bit value assigned by the <u>USB-IF</u> to identify a vendor.
vSafe0V	VBUS “0 volts” as defined by the <u>USB PD</u> specification.
vSafe5V	VBUS “5 volts” as defined by the <u>USB PD</u> specification.

2 Overview

2.1 Introduction

The USB Type-C™ receptacle, plug and cable provide a smaller, thinner and more robust alternative to existing [USB 3.1](#) interconnect (Standard and Micro USB cables and connectors). This new solution targets use in very thin platforms, ranging from ultra-thin notebook PCs down to smart phones where existing Standard-A and Micro-AB receptacles are deemed too large, difficult to use, or inadequately robust. Some key specific enhancements include:

- The USB Type-C receptacle may be used in very thin platforms as its total system height for the mounted receptacle is under 3 mm
- The USB Type-C plug enhances ease of use by being plug-able in either upside-up or upside-down directions
- The USB Type-C cable enhances ease of use by being plug-able in either direction between host and devices

While the USB Type-C interconnect no longer physically differentiates plugs on a cable by being an A-type or B-type, the USB interface still maintains such a host-to-device logical relationship. Determination of this host-to-device relationship is accomplished through a [Configuration Channel](#) (CC) that is connected through the cable. In addition, the [Configuration Channel](#) is used to set up and manage power and Alternate/Accessory Modes.

Using the [Configuration Channel](#), the USB Type-C interconnect defines a simplified 5 volt VBUS-based power delivery and charging solution that supplements what is already defined in the [USB 3.1 Specification](#). More advanced power delivery and battery charging features over the USB Type-C interconnect are based on the [USB Power Delivery Specification](#). As a product implementation improvement, the USB Type-C interconnect shifts the [USB PD](#) communication protocol from being communicated over VBUS to being delivered across the USB Type-C [Configuration Channel](#).

The USB Type-C receptacle, plug and cable designs are intended to support future USB functional extensions. As such, consideration was given to frequency scaling performance, pin-out arrangement and the configuration mechanisms when developing this solution. The definition of future USB functional extensions is not in the scope of this specification but rather will be provided in future releases of the base USB Specification, i.e., beyond the existing [USB 3.1 Specification](#).

Figure 2-1 illustrates the comprehensive functional signal plan for the USB [Full-Featured](#) Type-C receptacle, not all signals shown are required in all platforms or devices. As shown, the receptacle signal list functionally delivers both [USB 2.0](#) (D+ and D-) and [USB 3.1](#) (TX and RX pairs) data buses, USB power (VBUS) and ground (GND), [Configuration Channel](#) signals (CC1 and CC2), and two Sideband Use (SBU) signal pins. Multiple sets of USB data bus signal locations in this layout facilitate being able to functionally map the USB signals independent of plug orientation in the receptacle. For reference, the signal pins are labeled. [For the USB 2.0 Type-C receptacle, the USB 3.1 signals are not implemented.](#)

Figure 2-1 USB Type-C Receptacle Interface (Front View)

B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1

Figure 2-2 illustrates the comprehensive functional signal plan for the USB Type-C plug. Only one CC pin is connected through the cable to establish signal orientation and the other CC pin is repurposed as VCONN for powering electronics in the USB Type-C plug. Also, only one set of [USB 2.0](#) D+/D- wires are implemented in a USB Type-C cable. For USB Type-C cables that only intend to support [USB 2.0](#) functionality, the [USB 3.1](#) and SBU signals are not implemented. [For the USB Type-C Power-Only plug \(intended only for USB Type-C Sink applications\), only nine contacts are implemented to support CC, VBUS, and GND.](#)

2.2 USB Type-C Receptacles, Plugs and Cables

Cables and connectors, including USB Type-C to USB legacy cables and adapters, are explicitly defined within this specification. These are the only connectors and cables that are authorized by the licensing terms of this specification. All licensed cables and connectors are required to comply with the compliance and certification requirements that are developed and maintained by the [USB-IF](#).

The following USB Type-C receptacles and plugs are defined.

- USB [Full-Featured](#) Type-C receptacle for [USB 2.0](#), [USB 3.1](#) and full-featured platforms and devices
- [USB 2.0 Type-C receptacle for USB 2.0 platforms and devices](#)
- USB Full-Featured Type-C plug
- [USB 2.0 Type-C plug](#)
- [USB Type-C Power-Only plug](#)

The following USB Type-C cables are defined.

- USB Full-Featured Type-C cable with a USB Full-Featured Type-C plug at both ends for [USB 3.1](#) and full-featured applications
- [USB 2.0 Type-C cable with a USB 2.0 Type-C plug at both ends for USB 2.0 applications](#)
- Captive cable with either a USB Full-Featured Type-C plug or [USB 2.0](#) Type-C plug at one end

All of the defined USB Type-C receptacles, plugs and cables support USB charging applications, including support for the optional USB Type-C-specific implementation of the [USB Power Delivery Specification](#) (See Section 4.6.2.4).

All USB Full-Featured Type-C cables are electronically marked. [USB 2.0](#) Type-C cables may be electronically marked. See Section 4.9 for the requirements of [Electronically Marked Cables](#)[Electronically Marked Cables](#).

The following USB Type-C to USB legacy cables and adapters are defined.

- [USB 3.1](#) Type-C to Legacy Host cable with a USB Full-Featured Type-C plug at one end and a [USB 3.1](#) Standard-A plug at the other end – *this cable supports use of a USB Type-C-based device with a legacy USB host*
- [USB 2.0](#) Type-C to Legacy Host cable with a [USB 2.0](#) Type-C plug at one end and a [USB 2.0](#) Standard-A plug at the other end – *this cable supports use of a USB Type-C-based device with a legacy [USB 2.0](#) host (primarily for mobile charging and sync applications)*
- [USB 3.1](#) Type-C to Legacy Device cable with a USB Full-Featured Type-C plug at one end and a [USB 3.1](#) Standard-B plug at the other end – *this cable supports use of legacy [USB 3.1](#) hubs and devices with a USB Type-C-based host*
- [USB 2.0](#) Type-C to Legacy Device cable with a [USB 2.0](#) Type-C plug at one end and a [USB 2.0](#) Standard-B plug at the other end – *this cable supports use of legacy [USB 2.0](#) hubs and devices with a USB Type-C-based host*
- [USB 2.0](#) Type-C to Legacy Mini Device cable with a [USB 2.0](#) Type-C plug at one end and a [USB 2.0](#) Mini-B plug at the other end – *this cable supports use of legacy devices with a [USB 2.0](#) Type-C-based host*
- [USB 3.1](#) Type-C to Legacy Micro Device cable with a USB Full-Featured Type-C plug at one end and a [USB 3.1](#) Micro-B plug at the other end – *this cable supports use of legacy [USB 3.1](#) hubs and devices with a USB Type-C-based host*
- [USB 2.0](#) Type-C to Legacy Micro Device cable with a [USB 2.0](#) Type-C plug at one end and a [USB 2.0](#) Micro-B plug at the other end – *this cable supports use of legacy [USB 2.0](#) hubs and devices with a USB Type-C-based host*
- [USB 3.1](#) Type-C to Legacy Standard-A adapter with a USB Full-Featured Type-C plug at one end and a [USB 3.1](#) Standard-A receptacle at the other end – *this adapter supports use of a legacy USB “thumb drive” style device or a legacy USB ThinCard device with a [USB 3.1](#) Type-C-based host*
- [USB 2.0](#) Type-C to Legacy Micro-B adapter with a [USB 2.0](#) Type-C plug at one end and a [USB 2.0](#) Micro-B receptacle at the other end – *this adapter supports charging a USB Type-C-based mobile device using a legacy USB Micro-B-based chargers, either captive cable-based or used in conjunction with a legacy [USB 2.0](#) Standard-A to Micro-B cable*

USB Type-C receptacle to USB legacy adapters are explicitly not defined or allowed. Such adapters would allow many invalid and potentially unsafe cable connections to be constructed by users.

2.3 Configuration Process

The USB Type-C receptacle, plug and cable solution incorporates a configuration process to detect a downstream facing port to upstream facing port (Source-to-Sink) connection for VBUS management and host-to-device connected relationship determination.

The configuration process is used for the following:

- Source-to-Sink attach/detach detection
- Plug orientation/cable twist detection
- Initial power (Source-to-Sink) detection and establishing the data (Host-to-Device) relationship
- USB Type-C VBUS current detection and usage
- [USB PD](#) communication
- Discovery and configuration of functional extensions

Two pins on the USB Type-C receptacle, CC1 and CC2, are used for this purpose. Within a standard USB Type-C cable, only a single CC pin position within each plug of the cable is connected through the cable.

2.3.1 Source-to-Sink Attach/Detach Detection

Initially, Source-to-Sink attach is detected by a host or hub port (Source) when one of the CC pins at its USB Type-C receptacle senses a specified resistance to GND. Subsequently, Source-to-Sink detach is detected when the CC pin that was terminated at its USB Type-C receptacle is no longer terminated to GND.

Power is not applied to the USB Type-C host or hub receptacle (VBUS or VCONN) until the Source detects the presence of an attached device (Sink) port. When a Source-to-Sink attach is detected, the Source is expected to enable power to the receptacle and proceed to normal USB operation with the attached device. When a Source-to-Sink detach is detected, the port sourcing VBUS removes power.

2.3.2 Plug Orientation/Cable Twist Detection

The USB Type-C plug can be inserted into a receptacle in either one of two orientations, therefore the CC pins enable a method for detecting plug orientation in order to determine which SuperSpeed USB data signal pairs are functionally connected through the cable. This allows for signal routing, if needed, within a host or device to be established for a successful connection.

2.3.3 Initial Power (Source-to-Sink) Detection and Establishing the Data (Host-to-Device) Relationship

Unlike existing USB Type-A and USB Type-B receptacles and plugs, the mechanical characteristics of the USB Type-C receptacle and plug do not inherently establish the relationship of USB host and device ports. The CC pins on the receptacle also serve to establish an initial power (Source-to-Sink) and data (Host-to-Device) relationships prior to the normal USB enumeration process.

For the purpose of defining how the CC pins are used to establish the initial power relationship, the following port power behavior modes are defined.

1. Source-only – for this mode, the port exclusively behaves as a Source
2. Sink-only – for this mode, the port exclusively behaves as a Sink
3. Dual-Role-Power (DRP) – for this mode, the port can behave either as a Source or Sink

Additionally, when a port supports USB data operation, a port's data behavior modes are defined.

1. DFP-only – for this mode, the port exclusively behaves as a DFP
2. UFP-only – for this mode, the port exclusively behaves as a UFP
3. Dual-Role-Data (DRD) – for this mode, the port can behave either as a DFP or UFP

The DFP-only and UFP-only ports behaviorally map to traditional USB host ports and USB device ports, respectively but may not necessarily do USB data communication. When a host-only port is attached to a device-only port, the behavior from the user's perspective follows the traditional USB host-to-device port model. However, the USB Type-C connector solution does not physically prevent host-to-host or device-to-device connections. In this case, the resulting host-to-host or device-to-device connection results in a safe but non-functional situation.

Once initially established, the Source supplies VBUS and behaves as a DFP, and the Sink consumes VBUS and behaves as a UFP. [USB PD](#), when supported by both ports, may then be used to independently swap both the power and data roles of the ports.

A port that supports dual-role operation by being able to shift to the appropriate connected mode when attached to either a Source-only or Sink-only port is a DRP. In the special case of a DRP being attached to another DRP, an initialization protocol across the CC pins is used to establish the initial host-to-device relationship. Given no role-swapping intervention, the determination of which is DFP or UFP is random from the user's perspective.

Two independent set of mechanisms are defined to allow a USB Type-C DRP to functionally swap power and data roles. When [USB PD](#) is supported, power and data role swapping is performed as a subsequent step following the initial connection process. For non-PD implementations, power/data role swapping can optionally be dealt with as part of the initial connection process. To improve the user's experience when connecting devices that are of categorically different types, products may be implemented to strongly prefer being a DFP or a UFP, such that the DFP/UFP determination becomes predictable when connecting two DRPs of differing categories. See Section 4.5.1.4 for more on available swapping mechanisms.

As an alternative to role swapping, a USB Type-C DRP may provide useful functionality by when operating as a host, exposing a CDC/network (preferably TCP/IP) stack or when operating as a device, exposing a CDC/network interface.

USB hubs have two types of ports, a UFP that is connected up to a DFP (host or another hub) that initially functions as a Sink, and one or more DFPs for connecting other devices that initially function as Sources.

2.3.4 USB Type-C VBUS Current Detection and Usage

With the USB Type-C connector solution, a Source (host or downstream hub port) may implement higher source current over VBUS to enable faster charging of mobile devices or powering devices that require more current than is specified in the [USB 3.1 Specification](#). All USB host and hub ports advertise via the CC pins the level of current that is presently available. The USB device port is required to manage its load to stay within the current level offered by the host or hub, including dynamically scaling back the load if the host or hub port changes its advertisement to a lower level as indicated over the CC pins.

Three current levels at default VBUS are defined by [USB Type-C Current](#):

- Default values [when configured for high-power operation](#) as defined by a USB Specification (500 mA for USB 2.0 ports, 900 mA for USB 3.1 ports)
- 1.5 A
- 3.0 A

The higher [USB Type-C Current](#) levels that can be advertised allows hosts and devices that do not implement [USB PD](#) to take advantage of higher charging current.

2.3.5 USB PD Communication

[USB Power Delivery](#) is a feature on products (hosts, hubs and devices). [USB PD](#) communications is used to:

- Establish power contracts that allow voltage and current outside that defined by the [USB 2.0](#) and [USB 3.1](#) specifications.
- Change the port sourcing VBUS.

- Change the port sourcing VCONN.
- Swap DFP and UFP roles.
- Communicate with cables.

The [USB PD](#) Bi-phase Mark Coded (BMC) communications are carried on the CC wire of the USB Type-C cable.

2.3.6 Functional Extensions

Functional extensions (see Chapter 5) are enabled via a communications channel across CC using methods defined by the [USB Power Delivery Specification](#).

2.4 VBUS

VBUS provides a path to deliver power between a host and a device, and between a USB power charger and a host/device. A simplified high-current supply capability is defined for hosts and chargers that optionally support current levels beyond the [USB 2.0](#) and [USB 3.1](#) specifications. The [USB Power Delivery Specification](#) is supported.

Table 2-1 summarizes the power supply options available from the perspective of a device with the USB Type-C connector. Not all options will be available to the device from all host or hub ports – only the first two listed options are mandated by the base USB specifications and form the basis of [USB Type-C Current](#) at the Default USB Power level.

Table 2-1 Summary of power supply options

Mode of Operation	Nominal Voltage	Maximum Current	Notes
USB 2.0	5 V	See USB 2.0	
USB 3.1	5 V	See USB 3.1	
USB BC 1.2	5 V	Up to 1.5 A ¹	Legacy charging
USB Type-C Current @ 1.5 A	5 V	1.5 A	Supports higher power devices
USB Type-C Current @ 3.0 A	5 V	3 A	Supports higher power devices
USB PD	Configurable up to 20 V	Configurable up to 5 A	Directional control and power level management

Notes:

1. [USB BC 1.2](#) permits a power provider to be designed to support a level of power between 0.5 A and 1.5 A. If the [USB BC 1.2](#) power provider does not support 1.5 A, then it is required to follow power droop requirements. A [USB BC 1.2](#) power consumer may consume up to 1.5 A provided that the voltage does not drop below 2 V, which may occur at any level of power above 0.5 A.

The USB Type-C receptacle is specified for current capability of 5 A whereas standard USB Type-C cable assemblies are rated for 3 A. The higher rating of the receptacle enables systems to deliver more power over directly attached docking solutions or using appropriately designed chargers with captive cables when implementing [USB PD](#). Also, USB Type-C cable assemblies designed for [USB PD](#) and appropriately identified via electronic marking are allowed to support up to 5 A.

2.5 VCONN

Once the connection between host and device is established, the CC pin (CC1 or CC2) in the receptacle that is not connected via the CC wire through the standard cable is repurposed to source VCONN to power circuits in the plug needed to implement [Electronically Marked Cables](#) (see Section 4.9). Initially, the source supplies VCONN and the source of VCONN may be swapped using [USB PD](#) VCONN_Swap.

Electronically marked cables may use VBUS instead of VCONN as VBUS is available across the cable. VCONN functionally differs from VBUS in that it is isolated from the other end of the cable. VCONN is independent of VBUS and, unlike VBUS which can use [USB PD](#) to support higher voltages, VCONN voltage ~~is fixed at~~stays within the range of 3.0 to 5.5 V [\(see Section 4.4.3-1\)](#).

2.6 Hubs

USB hubs implemented with USB Type-C receptacles are required to clearly identify the upstream facing port. This requirement is needed because a user can no longer know which port on a hub is the upstream facing port and which ports are the downstream facing ports by the type of receptacles that are exposed, i.e., USB Type-B is the upstream facing port and USB Type-A is a downstream facing port.

3 Mechanical

3.1 Overview

3.1.1 Compliant Connectors

The USB Type-C™ specification defines the following standard connectors:

- USB Full-Featured Type-C receptacle
- USB 2.0 Type-C receptacle
- USB Full-Featured Type-C plug
- USB 2.0~~USB 2.0~~ Type-C plug
- USB Type-C Power-Only plug

3.1.2 Compliant Cable Assemblies

Table 3-1 summarizes the USB Type-C standard cable assemblies along with the primary differentiating characteristics. All USB Full-Featured Type-C cables shall support simultaneous, independent signal transmission on both USB 3.1 (TX and RX pairs) data buses. The cable lengths listed in the table are informative and represents the practical length based on cable performance requirements. All cables that are either full-featured and/or are rated at more than 3 A current are Electronically Marked Cables.

Table 3-1 USB Type-C Standard Cable Assemblies

Cable Ref	Plug 1	Plug 2	USB Version	Cable Length	Current Rating	USB Power Delivery (BMC)	USB Type-C Electronically Marked
CC2-3	C	C	USB 2.0	$\leq 4\text{ m}$	3 A	Supported	Optional
CC2-5					5 A		Required
CC3G1-3	C	C	USB 3.1 Gen1	$\leq 2\text{ m}$	3 A	Supported	Required
CC3G1-5					5 A		
CC3G2-3	C	C	USB 3.1 Gen2	$\leq 1\text{ m}$	3 A	Supported	Required
CC3G2-5					5 A		

USB Type-C products are also allowed to have a captive cable. See Section 3.4.3.

3.1.3 Compliant USB Type-C to Legacy Cable Assemblies

Table 3-2 summarizes the USB Type-C legacy cable assemblies along with the primary differentiating characteristics. The cable lengths listed in the table are informative and represents the practical length based on cable performance requirements. USB 3.1 Type-C legacy cables assemblies that only offer performance up to USB 3.1 Gen1 are not allowed by this specification.

For USB Type-C legacy cable assemblies that incorporate Rp termination, the value of this termination is required to be specified to the Default setting of USB Type-C Current even though the cable assemblies are rated for 3 A. The Rp termination in these cables is intended to represent the maximum current of a compliant legacy USB host port, not the current rating of the cable itself. The cable current rating is intentionally set to a higher level given that there are numerous non-standard power chargers that offer more than the Default levels established by the USB 2.0 and USB 3.1 specifications.

Table 3-2 USB Type-C Legacy Cable Assemblies

Cable Ref	Plug 1 ⁴ ₁ ³	Plug 2 ⁴ ₂ ³	USB Version	Cable Length	Current Rating
AC2-3	USB 2.0 Standard-A	USB 2.0 Type-C ¹	USB 2.0	≤ 4 m	3 A
AC3G2-3	USB 3.1 Standard-A	USB Full-Featured Type-C ¹	USB 3.1 Gen2	≤ 1 m	3 A
CB2-3	USB 2.0 Type-C ²	USB 2.0 Standard-B	USB 2.0	≤ 4 m	3 A
CB3G2-3	USB Full-Featured Type-C ²	USB 3.1 Standard-B	USB 3.1 Gen2	≤ 1 m	3 A
CmB2	USB 2.0 Type-C ²	USB 2.0 Mini-B	USB 2.0	≤ 4 m	500 mA
CuB2-3	USB 2.0 Type-C ²	USB 2.0 Micro-B	USB 2.0	≤ 2 m	3 A
CuB3G2-3	USB Full-Featured Type-C ²	USB 3.1 Micro-B	USB 3.1 Gen2	≤ 1 m	3 A

Notes:

1. USB Type-C plugs associated with the “B” end of a legacy adapter cable are required to have Rp ($56 \text{ k}\Omega \pm 5\%$) termination incorporated into the plug assembly – see Section 4.5.3.2.2.
2. USB Type-C plugs associated with the “A” end of a legacy adapter cable are required to have Rd ($5.1 \text{ k}\Omega \pm 20\%$) termination incorporated into the plug assembly – see Section 4.5.3.2.1.
3. Refer to Section 3.7.4.3 for the mated resistance and temperature rise required for the legacy plugs.

3.1.4 Compliant USB Type-C to Legacy Adapter Assemblies

Table 3-3 summarizes the USB Type-C legacy adapter assemblies along with the primary differentiating characteristics. The cable lengths listed in the table are informative and represents the practical length based on cable performance requirements.

Table 3-3 USB Type-C Legacy Adapter Assemblies

Adapter Ref	Plug	Receptacle ³	USB Version	Cable Length	Current Rating
CuBR2-3	USB 2.0 Type-C ¹	USB 2.0 Micro-B	USB 2.0	≤ 0.15 m	3 A
CAR3G1-3	USB Full-Featured Type-C ²	USB 3.1 Standard-A	USB 3.1 Gen1	≤ 0.15 m	3 A

Notes:

1. USB Type-C plugs associated with the “B” end of a legacy adapter are required to have Rp ($56 \text{ k}\Omega \pm 5\%$) termination incorporated into the plug assembly – see Section 4.5.3.2.2.
2. USB Type-C plugs associated with the “A” end of a legacy adapter are required to have Rd ($5.1 \text{ k}\Omega \pm 20\%$) termination incorporated into the plug assembly – see Section 4.5.3.2.1.
3. Refer to Section 3.7.5.3 for the mated resistance and temperature rise required for the legacy receptacles.

3.2 USB Type-C Connector Mating Interfaces

This section defines the connector mating interfaces, including the connector interface drawings, pin assignments, and descriptions. All dimensions in figures are in millimeters

3.2.1 Interface Definition

Figure 3-1 and Figure 3-3 show, respectively, the USB Type-C receptacle and USB Full-Featured Type-C plug interface dimensions.

Figure 3-11 shows the [USB 2.0](#) Type-C plug interface dimensions. The dimensions that govern the mating interoperability are specified. All the REF dimensions are provided for reference only, not hard requirements.

Key features, configuration options, and design areas that need attention:

1. Figure 3-1 shows a vertical-mount receptacle. Other PCB mounting types such as right-angle mount and mid-mount are allowed.
2. A mid-plate is required between the top and bottom signals inside the receptacle tongue to manage crosstalk in full-featured applications. The mid-plate shall be connected to the PCB ground with at least two grounding points. A reference design of the mid-plate is provided in Section 3.2.2.1.
3. Retention of the cable assembly in the receptacle is achieved by the side-latches in the plug and features on the sides of the receptacle tongue. Side latches are required for all plugs except plugs used for docking with no cable attached. Side latches shall be connected to ground inside the plug. A reference design of the side latches is provided in Section 3.2.2.2 along with its grounding scheme. Docking applications may not have side latches, requiring special consideration regarding EMC (Electromagnetic Compatibility).
4. The EMC shielding springs are required inside the cable plug. The shielding spring shall be connected to the plug shell. No EMC shielding spring finger tip of the USB Full-Featured Type-C plug or USB 2.0 Type-C plug shall be exposed in the plug housing opening of the unmated USB Type-C plug (see Figure 3-12). Section 3.2.2.3 shows reference designs of the EMC spring.
5. Shorting of any signal or power contact spring to the plug metal shell is not allowed. The spring in the deflected state should not touch the plug shell. An isolation layer (e.g., Kapton tape placed on the plug shell) is recommended to prevent accidental shorting due to plug shell deformation.
6. The USB Type-C receptacle shall provide an EMC ground return path through one of the following options:
 - Fingers in a system of specific points of contact on the receptacle outer shell (e.g., spring fingers or spring fingers and formed solid bumps),
 - internal EMC pads, or
 - ~~Both external fingers in the shell and internal EMC pads~~
 - If fingers in a combination of both points of contact on the receptacle outer shell and internal EMC pads.

If points of contacts are used on the receptacle, then the receptacle springs-points of contact shall make connection with the mated plug within the contact zones defined in Figure 3-2. A minimum of four separate points of contact-points are required. Additional fingers-and points of contact are allowed. See Section 3.2.2.4 for a reference design of receptacle outer shell. The reference design includes four spring fingers as points of contact. Alternate configurations may include spring fingers on the A contact side or B contact side and formed solid bumps (e.g., dimples) on the B contact side or A contact side, respectively. Spring fingers are required on a minimum of one side to provide a pressure fit on opposing sides of the plug shell. Additional bumps may be used, but if bumps are on opposing sides of the receptacle shell, the minimum distance between the bumps shall be greater than the maximum plug shell defined dimension.

If internal EMC pads are present in the receptacle, then they shall comply with the requirements defined in Figure 3-1. The shielding pads shall be connected to the receptacle shell. If no receptacle shell is present, then the receptacle shall provide a means to connect the shielding pad to ground. See Section 3.2.2.3 for a reference design of the shielding pad and ground connection.
7. This specification defines the USB Type-C receptacle shell length of 6.20 mm as a reference dimension. The USB Type-C receptacle is designed to have shell length of

6.20 ± 0.20 mm to provide proper mechanical and electrical mating of the plug to the receptacle (e.g., full seating of the plug in the receptacle and protection of the receptacle tongue during insertion/withdrawal). The USB Type-C receptacle at the system level should be implemented such that the USB Type-C receptacle connector mounted in the associated system hardware has an effective shell length equal to 6.20 ± 0.20 mm.

8. The USB Type-C connector mating interface is defined so that the electrical connection may be established without the receptacle shell. To prevent excessive misalignment of the plug when it enters or exits the receptacle, the enclosure should have features to guide the plug for insertion and withdrawal when a modified receptacle shell is present. If the USB Type-C receptacle shell is modified from the specified dimension, then the recommended lead in from the receptacle tongue to the plug point of entry is 1.5 mm minimum when mounted in the system.

This specification allows receptacle configurations with a conductive shell, a non-conductive shell, or no shell. The following requirements apply to the receptacle contact dimensions shown in SECTION A-A and ALTERNATE SECTION A-A shown in Figure 3-1:

- If the receptacle shell is conductive, then the receptacle contact dimensions of SECTION A-A shown in Figure 3-1 shall be used. The contact dimensions of ALTERNATE SECTION A-A are not allowed.
 - If the receptacle shell is non-conductive, then the receptacle contact dimensions of ALTERNATE SECTION A-A shown in Figure 3-1 shall be used. The contact dimensions of SECTION A-A are not allowed.
 - If there is no receptacle shell, then the receptacle contact dimensions of either SECTION A-A or ALTERNATE SECTION A-A shown in Figure 3-1 may be used. If there is no receptacle shell and the receptacle is used in an implementation that does not effectively provide a conductive shell, then a receptacle with the contact dimensions of ALTERNATE SECTION A-A shown in Figure 3-1 should be used.
9. A paddle card (e.g., PCB) may be used in the USB Type-C plug to manage wire termination and electrical performance. Section 3.2.2.5 includes the guidelines and a design example for a paddle card.
 10. This specification does not define standard footprints. Figure 3-4 shows an example SMT (surface mount) footprint for the vertical receptacle shown in Figure 3-1. Additional reference footprints and mounting configurations are shown in Figure 3-5, Figure 3-6, Figure 3-7, Figure 3-8, [Figure 3-9](#) and [Figure 3-10](#).
 11. The receptacle shell shall be connected to the PCB ground plane.
 12. All VBUS pins shall be connected together in the USB Type-C plug.
 13. All Ground return pins shall be connected together in the USB Type-C plug.
 14. All VBUS pins shall be connected together at the USB Type-C receptacle when it is in its mounted condition (e.g., all VBUS pins bussed together in the PCB).
 15. All Ground return pins shall be connected together at the USB Type-C receptacle when it is in its mounted condition (e.g., all Ground return pins bussed together in the PCB).
 16. [The USB Type-C Power-Only plug is a depopulated version of the USB Full-Featured Type-C plug or the USB 2.0 Type-C plug. The interface dimensions shall conform to Figure 3-3 or Figure 3-11. Contacts for CC, VBUS, and GND \(i.e., A1, A4, A5, A9, A12, B1, B4, B9, and B12\) shall be present. Physical presence of contacts in the other 15 contact locations is optional. The USB Type-C Power-Only plug shall only be used on](#)

a non-charger captive cable application. Implementation of Rp, Rd, or CC communication on pin A5 is required in the application.

PCB TOP SURFACE

This specification requires that all contacts be present in the mating interface of the USB [Full-Featured Type-C receptacle connector and all contacts except the *USB 3.1* signals \(i.e., A2, A3, A10, A11, B2, B3, B10 and B11\) be present in the mating interface of the *USB 2.0*](#) Type-C receptacle connector, but allows the plug to include only the contacts required for [USB PD](#) and [USB 2.0](#) functionality for applications that only support [USB 2.0](#). The [USB 2.0](#) Type-C plug is shown in Figure 3-11. The following design simplifications may be made when only [USB 2.0](#) is supported:

- Only the contacts necessary to support [USB PD](#) and [USB 2.0](#) are required in the plug. All other pin locations may be unpopulated. See Table 3-5. All contacts are required to be present in the mating interface of the USB Type-C receptacle connector.
- Unlike the USB Full-Featured Type-C plug, the internal EMC springs may be formed from the same strip as the signal, power, and ground contacts. The internal EMC springs contact the inner surface of the plug shell and mate with the receptacle EMC pads when the plug is seated in the receptacle. Alternately, the [USB 2.0](#) Type-C plug may use the same EMC spring configuration as defined for the USB Full-Featured Type-C plug. The [USB 2.0](#) Type-C plug four EMC spring locations are defined in Figure 3-11. The alternate configuration using the six spring locations is defined in Figure 3-1. Also refer to the reference designs in 3.2.2.3 for further clarification.
- A paddle card inside the plug may not be necessary if wires are directly attached to the contact pins.

Figure 3-9 USB 2.0 Type-C Plug Interface Dimensions, cont.

Figure 3-12 USB Type-C Plug EMC Shielding Spring Tip Requirements

3.2.2 Reference Designs

This section provides reference designs for a few key features of the USB Type-C connector. The reference designs are provided as acceptable design examples. They are not normative.

3.2.2.1 Receptacle Mid-Plate (Informative)

The signals between the top and bottom of the receptacle tongue are isolated by a mid-plate inside the tongue. Figure 3-13 shows a reference design of the mid-plate. It is important to pay attention to the following features of the middle plate:

- The distance between the signal contacts and the mid-plate should be accurately controlled since the variation of this distance may significantly impact impedance of the connector.
- The mid-plate in this particular design protrudes slightly beyond the front surface of the tongue. This is to protect the tongue front surface from damage caused by miss-insertion of small objects into the receptacle.
- The mid-plate is required to be directly connected to the PCB ground with at least two grounding points.
- The sides of the mid-plate mate with the plug side latches, making ground connections to reduce EMC. Proper surface finishes are necessary in the areas where the side latches and mid-plate connections occur.

Figure 3-13 Reference Design of Receptacle Mid-Plate

3.2.2.2 Side Latch (informative)

The side latches (retention latches) are located in the plug. Figure 3-14 shows a reference design of a blanked side latch. The plug side latches should contact the receptacle mid-plate to provide an additional ground return path.

Figure 3-14 Reference Design of the Retention Latch

Figure 3-15 Illustration of the Latch Soldered to the Paddle Card Ground

3.2.2.3 Internal EMC Springs and Pads (Informative)

Figure 3-16 is a reference design of the internal EMC spring located inside the USB Full-Featured Type-C plug. Figure 3-17 is a reference design of the internal EMC spring located inside the [USB 2.0](#) Type-C plug.

Figure 3-16 Reference Design of the USB Full-Featured Type-C Plug Internal EMC Spring

Figure 3-17 Reference Design of the USB 2.0 Type-C Plug Internal EMC Spring

It is critical that the internal EMC spring contacts the plug shell as close to the EMC spring mating interface as possible to minimize the length of the return path.

The internal EMC pad (i.e., ground plate) shown in Figure 3-18 is inside the receptacle. It mates with the EMC spring in the plug. To provide an effective ground return, the EMC pads should have multiple connections with the receptacle shell.

Figure 3-18 Reference Design of Internal EMC Pad

3.2.2.4 Optional External Receptacle EMC Springs (Informative)

Some applications may use receptacles with EMC springs that contact the outside of the plug shell. Figure 3-19 shows a reference receptacle design with external EMC springs. The EMC spring contact landing zones for the fully mated condition are normative and defined in Section 3.2.1.

Figure 3-19 Reference Design of a USB Type-C Receptacle with External EMC Springs

3.2.2.5 USB Full-Featured Type-C Plug Paddle Card (Informative)

The use of a paddle card is expected in the USB Full-Featured Type-C Plug. Figure 3-20 illustrates the paddle card pin assignment and contact spring connection location for a USB Full-Featured Type-C plug. The following guidelines are provided for the paddle card design:

- The paddle card should use high performance substrate material. The recommended paddle card thickness should have a tolerance less than or equal to $\pm 10\%$.
- The USB SuperSpeed traces should be as short as possible and have a nominal differential characteristic impedance of 85Ω .
- The wire attach should have two high speed differential pairs on one side and two other high speed differential pairs on the other side, separated as far as practically allowed.
- It is recommended that a grounded coplanar waveguide (CPWG) system be selected as a transmission line method.
- Use of vias should be minimized.
- VBUS pins should be bussed together on the paddle card.
- GND pins should be bussed together on the paddle card.

Figure 3-20 Reference Design for a USB Full-Featured Type-C Plug Paddle Card

3.2.3 Pin Assignments and Descriptions

The usage and assignments of the 24 pins for the USB Type-C receptacle interface are defined in Table 3-4.

Table 3-4 USB Type-C Receptacle Interface Pin Assignments

Pin	Signal Name	Description	Mating Sequence	Pin	Signal Name	Description	Mating Sequence
A1	GND	Ground return	First	B12	GND	Ground return	First
A2	SSTXp1	Positive half of first SuperSpeed TX differential pair	Second	B11	SSRXp1	Positive half of first SuperSpeed RX differential pair	Second
A3	SSTXn1	Negative half of first SuperSpeed TX differential pair	Second	B10	SSRXn1	Negative half of first SuperSpeed RX differential pair	Second
A4	VBUS	Bus Power	First	B9	VBUS	Bus Power	First
A5	CC1	Configuration Channel	Second	B8	SBU2	Sideband Use (SBU)	Second
A6	Dp1	Positive half of the USB 2.0 differential pair – Position 1	Second	B7	Dn2	Negative half of the USB 2.0 differential pair – Position 2	Second
A7	Dn1	Negative half of the USB 2.0 differential pair – Position 1	Second	B6	Dp2	Positive half of the USB 2.0 differential pair – Position 2	Second
A8	SBU1	Sideband Use (SBU)	Second	B5	CC2	Configuration Channel	Second
A9	VBUS	Bus Power	First	B4	VBUS	Bus Power	First
A10	SSRXn2	Negative half of second SuperSpeed RX differential pair	Second	B3	SSTXn2	Negative half of second SuperSpeed TX differential pair	Second
A11	SSRXp2	Positive half of second SuperSpeed RX differential pair	Second	B2	SSTXp2	Positive half of second SuperSpeed TX differential pair	Second
A12	GND	Ground return	First	B1	GND	Ground return	First

Notes:

1. Contacts B6 and B7 should not be present in the USB Type-C plug. The receptacle side shall support the [USB 2.0](#) differential pair present on Dp1/Dn1 or Dp2/Dn2. The plug orientation determines which pair is active. In one implementation, Dp1 and Dp2 may be shorted on the host/device as close to the receptacle as possible to minimize stub length; Dn1 and Dn2 may also be shorted. The maximum shorting trace length should not exceed 3.5 mm.
2. All VBUS pins shall be connected together within the USB Type-C plug and shall be connected together at the USB Type-C receptacle connector when the receptacle is in its mounted condition (e.g., all VBUS pins bussed together on the PCB).
3. All Ground return pins shall be connected together within the USB Type-C plug and shall be connected together at the USB Type-C receptacle connector when the receptacle is in its mounted condition (e.g., all ground return pins bussed together on the PCB).
4. If the contact dimensions shown in Figure 3-1 ALTERNATE SECTION A-A are used, then the VBUS contacts (A4, A9, B4 and B9) mate second, and signal contacts (A2, A3, A5, A6, A7, A8, A10, A11, B2, B3, B5, B6, B7, B8, B10 and B11) mate third.

The usage and assignments of the signals necessary for the support of only [USB 2.0](#) with the USB Type-C mating interface are defined in Table 3-5.

Table 3-5 USB Type-C Receptacle Interface Pin Assignments for USB 2.0-only Support

Pin	Signal Name	Description	Mating Sequence	Pin	Signal Name	Description	Mating Sequence
A1	GND	Ground return	First	B12	GND	Ground return	First
A2				B11			
A3				B10			
A4	VBUS	Bus Power	First	B9	VBUS	Bus Power	First
A5	CC1	Configuration Channel	Second	B8	SBU2	Sideband Use (SBU)	Second

A7	Dn1	Negative half of the USB 2.0 differential pair – Position 1	Second	B6	Dp2	Positive half of the USB 2.0 differential pair – Position 2	Second
A8	SBU1	Sideband Use (SBU)	Second	B5	CC2	Configuration Channel	Second
A9	VBUS	Bus Power	First	B4	VBUS	Bus Power	First
A10				B3			
A11				B2			
A12	GND	Ground return	First	B1	GND	Ground return	First

Notes:

1. ~~The unused contacts shall not be physically depopulated in the USB Type-C receptacle.~~ Unused contact locations shall be electrically isolated from power, ground or signaling (i.e., not connected).
2. Contacts B6 and B7 should not be present in the USB Type-C plug. The receptacle side shall support the [USB 2.0](#) differential pair present on Dp1/Dn1 or Dp2/Dn2. The plug orientation determines which pair is active. In one implementation, Dp1 and Dp2 may be shorted on the host/device as close to the receptacle as possible to minimize stub length; Dn1 and Dn2 may also be shorted. The maximum shorting trace length should not exceed 3.5 mm.
3. Contacts A8 and B8 (SBU1 and SBU2) shall be not connected unless required for a specified purpose (e.g., [Audio Adapter Accessory Mode](#)).
4. All VBUS pins shall be connected together within the USB Type-C plug and shall be connected together at the USB Type-C receptacle connector when the receptacle is in its mounted condition (e.g., all VBUS pins bussed together on the PCB).
5. All Ground return pins shall be connected together within the USB Type-C plug and shall be connected together at the USB Type-C receptacle connector when the receptacle is in its mounted condition (e.g., all ground return pins bussed together on the PCB).
6. If the contact dimensions shown in Figure 3-1 ALTERNATE SECTION A-A are used then the VBUS contacts (A4, A9, B4 and B9) mate second, and signal contacts (A5, A6, A7, A8, B5, B6, B7 and B8) mate third.

3.3 Cable Construction and Wire Assignments

This section discusses the USB Type-C cables, including cable construction, wire assignments, and wire gauges.

3.3.1 Cable Construction (Informative)

Figure 3-21 illustrates an example of USB Full-Featured Type-C cable cross-section, using micro-coaxial wires for USB SuperSpeed. There are four groups of wires: USB D+/D- (typically unshielded twisted pairs (UTP)), USB SuperSpeed signal pairs (coaxial wires, twin-axial or shielded twisted pairs), sideband signal wires, and power and ground wires. In this example, the optional VCONN wire is shown whereas in Figure 3-22 the example is shown

with the VCONN wire removed – the inclusion of VCONN or not relates to the implementation approach chosen for [Electronically Marked Cables](#) (See Section 4.9).

Figure 3-21 Illustration of a USB Full-Featured Type-C Cable Cross Section, a Coaxial Wire Example with VCONN

Figure 3-22 Illustration of a USB Full-Featured Type-C Cable Cross Section, a Coaxial Wire Example without VCONN

The USB D+/D- signal pair is intended to transmit the [USB 2.0](#) Low-Speed, Full-Speed and High-Speed signaling while the SuperSpeed signal pairs are used for [USB 3.1](#) SuperSpeed signaling. Shielding is needed for the SuperSpeed differential pairs for signal integrity and EMC performance.

3.3.2 Wire Assignments

Table 3-6 defines the full set of possible wires needed to produce all standard USB Type-C cables assemblies. For some cable assemblies, not all of these wires are used. For example, a USB Type-C cable that only provides [USB 2.0](#) functionality will not include wires 6-15.

Table 3-6 USB Type-C Standard Cable Wire Assignments

Wire Number	Signal Name	Description
1	GND_PWRrt1	Ground for power return
2	PWR_VBUS1	VBUS power
3	CC	Configuration Channel
4	UTP_Dp	Unshielded twist pair, positive
5	UTP_Dn	Unshielded twist pair, negative
6	SDPp1	Shielded differential pair #1, positive
7	SDPn1	Shielded differential pair #1, negative
8	SDPp2	Shielded differential pair #2, positive
9	SDPn2	Shielded differential pair #2, negative
10	SDPp3	Shielded differential pair #3, positive
11	SDPn3	Shielded differential pair #3, negative
12	SDPp4	Shielded differential pair #4, positive
13	SDPn4	Shielded differential pair #4, negative
14	SBU_A	Sideband Use
15	SBU_B	Sideband Use
16	GND_PWRrt2	Ground for power return (optional)
17	PWR_VBUS2	VBUS power (optional)
18	PWR_VCONN	VCONN power (optional, see Section 4.9)
Braid	Shield	Cable external braid

Note:

1. This table is based on the assumption that coaxial wire construction is used for all SDP's and there are no drain wires. The signal ground return is through the shields of the coaxial wires. If shielded twisted or twin-axial pairs are used, then drain wires are needed.

Table 3-7 defines the full set of possible wires needed to produce USB Type-C to legacy cable assemblies. For some cable assemblies, not all of these wires are needed. For example, a USB Type-C to [USB 2.0](#) Standard-B cable will not include wires 5-10.

Table 3-7 USB Type-C Cable Wire Assignments for Legacy Cables/Adapters

Wire Number	Signal Name	Description
1	GND_PWRrt1	Ground for power return
2	PWR_VBUS1	VBUS power
3	UTP_Dp	Unshielded twist pair, positive
4	UTP_Dn	Unshielded twist pair, negative
5	SDPp1	Shielded differential pair #1, positive
6	SDPn1	Shielded differential pair #1, negative
7	SDP1_Drain	Drain wire for SDPp1 and SDPn1
8	SDPp2	Shielded differential pair #2, positive
9	SDPn2	Shielded differential pair #2, negative
10	SDP2_Drain	Drain wire for SDPp2 and SDPn2
Braid	Shield	Cable external braid

Note:

- a. This table is based on the assumption that shielded twisted pair is used for all SDP's and there are drain wires. If coaxial wire construction is used, then no drain wires are needed and the signal ground return is through the shields of the coaxial wires.

3.3.3 Wire Gauges and Cable Diameters (Informative)

This specification does not specify wire gauge. Table 3-8 and Table 3-9 list typical wire gauges for reference purposes only. A large gauge wire incurs less loss, but at the cost of cable diameter and flexibility. Multiple wires may be used for a single wire such as for VBUS or Ground. It is recommended to use the smallest possible wire gauges that meet the cable assembly electrical and mechanical requirements.

To maximize cable flexibility, all wires should be stranded and the cable outer diameter should be minimized as much as possible. A typical USB Full-Featured Type-C cable outer diameter may range from 4 mm to 6 mm while a typical [USB 2.0](#) Type-C cable outer diameter may range from 2 mm to 4 mm. A typical USB Type-C to [USB 3.1](#) legacy cable outer diameter may range from 3 mm to 5 mm.

Table 3-8 Reference Wire Gauges for standard USB Type-C Cable Assemblies

Wire Number	Signal Name	Wire Gauge (AWG)
1	GND_PWRrt1	20-28
2	PWR_VBUS1	20-28
3	CC	32-34
4	UTP_Dp	28-34
5	UTP_Dn	28-34
6	SDPp1	26-34
7	SDPn1	26-34
8	SDPp2	26-34
9	SDPn2	26-34
10	SDPp3	26-34
11	SDPn3	26-34
12	SDPp4	26-34
13	SDPn4	26-34
14	SBU_A	32-34
15	SBU_B	32-34
16	GND_PWRrt2	20-28
17	PWR_VBUS2	20-28
18	PWR_VCONN	32-34

Table 3-9 Reference Wire Gauges for USB Type-C to Legacy Cable Assemblies

Wire Number	Signal Name	Wire Gauge (AWG)
1	GND_PWRrt1	20-28
2	PWR_VBUS1	20-28
3	UTP_Dp	28-34
4	UTP_Dn	28-34
5	SDPp1	26-34
6	SDPn1	26-34
7	SDP1_Drain	28-34
8	SDPp2	26-34
9	SDPn2	26-34
10	SDP2_Drain	28-34

3.4 Standard USB Type-C Cable Assemblies

Two standard USB Type-C cable assemblies are defined and allowed by this specification. In addition, captive cables are allowed (see Section 3.4.3). Shielding (braid) is required to enclose all the wires in the USB Type-C cable. The shield shall be terminated to the plug metal shells. The shield should be physically connected to the plug metal shell as close to 360° as possible, to control EMC.

3.4.1 USB Full-Featured Type-C Cable Assembly

Figure 3-23 shows a USB Full-Featured Type-C standard cable assembly.

Figure 3-23 USB Full-Featured Type-C Standard Cable Assembly

Table 3-10 defines the wire connections for the USB Full-Featured Type-C standard cable assembly.

Table 3-10 USB Full-Featured Type-C Standard Cable Assembly Wiring

USB Type-C Plug #1		Wire		USB Type-C Plug #2	
Pin	Signal Name	Wire Number	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	1 [16]	GND_PWRrt1 [GND_PWRrt2]	A1, B1, A12, B12	GND
A4, B4, A9, B9	VBUS	2 [17]	PWR_VBUS1 [PWR_VBUS2]	A4, B4, A9, B9	VBUS
A5	CC	3	CC	A5	CC
B5	VCONN	18	PWR_VCONN (See Section 4.9)	B5	VCONN
A6	Dp1	4	UTP_Dp	A6	Dp1
A7	Dn1	5	UTP_Dn	A7	Dn1
A2	SSTXp1	6	SDPp1	B11	SSRXp1
A3	SSTXn1	7	SDPn1	B10	SSRXn1
B11	SSRXp1	8	SDPp2	A2	SSTXp1
B10	SSRXn1	9	SDPn2	A3	SSTXn1
B2	SSTXp2	10	SDPp3	A11	SSRXp2
B3	SSTXn2	11	SDPn3	A10	SSRXn2
A11	SSRXp2	12	SDPp4	B2	SSTXp2
A10	SSRXn2	13	SDPn4	B3	SSTXn2
A8	SBU1	14	SBU_A	B8	SBU2
B8	SBU2	15	SBU_B	A8	SBU1
Shell	Shield	<u>BraidOuter shield</u>	Shield	Shell	Shield

Notes:

1. This table is based on the assumption that coaxial wire construction is used for all SDP's and there are no drain wires. The shields of the coaxial wires are connected to the ground pins. If shielded twisted pair is used, then drain wires are needed and shall be connected to the GND pins.
2. Pin B5 (VCONN) of the USB Type-C plug shall be used in electronically marked versions of this cable. See Section 4.9.
3. Contacts B6 and B7 should not be present in the USB Type-C plug.
4. All VBUS pins shall be connected together within the USB Type-C plug. A 10 nF bypass capacitor (minimum voltage rating of 30 V) is required for the VBUS pin in the full-featured cable at each end of the cable. The bypass capacitor should be placed as close as possible to the power supply pad.
5. All GND pins shall be connected together within the USB Type-C plug-
- 5.6. Shield and GND shall be connected within the USB Type-C plug on both ends of the cable assembly.

3.4.2 USB 2.0 Type-C Cable Assembly

A [USB 2.0](#) Type-C standard cable assembly has the same form factor shown in Figure 3-23.

Table 3-11 defines the wire connections for the [USB 2.0](#) Type-C standard cable assembly.

Table 3-11 [USB 2.0](#) Type-C Standard Cable Assembly Wiring

USB Type-C Plug #1		Wire		USB Type-C Plug #2	
Pin	Signal Name	Wire Number	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	1	GND_PWRrt1	A1, B1, A12, B12	GND
A4, B4, A9, B9	VBUS	2	PWR_VBUS1	A4, B4, A9, B9	VBUS
A5	CC	3	CC	A5	CC
B5	VCONN	18	PWR_VCONN (See Section 4.9)	B5	VCONN
A6	Dp1	4	UTP_Dp	A6	Dp1
A7	Dn1	5	UTP_Dn	A7	Dn1
Shell	Shield	<u>BraidedOuterShield</u>	Shield	Shell	Shield

Notes:

1. Pin B5 (VCONN) of the USB Type-C plug shall be used in electronically marked versions of this cable. See Section 4.9.
2. Contacts B6 and B7 should not be present in the USB Type-C plug.
3. All VBUS pins shall be connected together within the USB Type-C plug. A bypass capacitor is not required for the VBUS pin in the [USB 2.0](#) Type-C cable.
4. All GND pins shall be connected together within the USB Type-C plug.
5. All USB Type-C plug pins that are not listed in this table shall be open (not connected).
- 5.6. Shield and GND grounds shall be connected within the USB Type-C plug on both ends of the cable assembly.

3.4.3 USB Type-C Captive Cable Assemblies

A captive cable assembly is a cable assembly that is terminated on one end with a USB Type-C plug and has a vendor-specific connect means (hardwired or custom detachable) on the opposite end. The cable assembly that is hardwired is not detachable from the device.

The assembly wiring for captive USB Type-C cables follow the same wiring assignments as the standard cable assemblies (see Table 3-10 and Table 3-11) with the exception that the hardwired attachment on the device side substitutes for the USB Type-C Plug #2 end.

The CC wire in a captive cable shall be terminated and behave as appropriate to the function of the product to which it is captive (e.g. host or device).

This specification does not define how the hardwired attachment is physically done on the device side.

3.5 Legacy Cable Assemblies

To enable interoperability between USB Type-C-based products and legacy USB products, the following standard legacy cable assemblies are defined. Only the cables defined within this specification are allowed.

Legacy cable assemblies that source power to a USB Type-C connector (e.g. a USB Type-C to USB Standard-A plug cable assembly and a USB Type-C plug to USB Micro-B receptacle adapter assembly) are required to use the Default USB Type-C Current R_p resistor ($56\text{ k}\Omega$). The value of R_p is used to inform the Sink how much current the Source can provide. Since the legacy cable assembly does not comprehend the capability of the Source it is connected to, it is only allowed to advertise Default USB Type-C Current as defined by the [USB 2.0](#), [USB](#)

[3.1](#) and [BC 1.2](#) specifications. No other R_p values are permitted because these may cause a USB Type-C Sink to overload a legacy power supply.

3.5.1 USB Type-C to [USB 3.1](#) Standard-A Cable Assembly

Figure 3-24 shows a USB Type-C to [USB 3.1](#) Standard-A cable assembly.

Figure 3-24 USB Type-C to USB 3.1 Standard-A Cable Assembly

Table 3-12 defines the wire connections for the USB Type-C to [USB 3.1](#) Standard-A cable assembly.

Table 3-12 USB Type-C to [USB 3.1](#) Standard-A Cable Assembly Wiring

USB Type-C Plug		Wire		USB 3.1 Standard-A plug	
Pin	Signal Name	Wire Number	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	1 7, 10	GND_PWRrt1 SDP1_Drain, SDP2_Drain	4 7	GND GND_DRAIN
A4, B4, A9, B9	VBUS	2	PWR_VBUS1	1	VBUS
A5	CC	See Note 2			
B5	VCONN				
A6	Dp1	3	UTP_Dp	3	D+
A7	Dn1	4	UTP_Dn	2	D-
A2	SSTXp1	5	SDPp1	6	StdA_SSRX+
A3	SSTXn1	6	SDPn1	5	StdA_SSRX-
B11	SSRXp1	8	SDPp2	9	StdA_SSTX+
B10	SSRXn1	9	SDPn2	8	StdA_SSTX-
Shell	Shield	<u>BraidOut er shield</u>	Shield	Shell	Shield

Notes:

- This table is based on the assumption that shielded twisted pair is used for all SDP's and there are drain wires. If coaxial wire construction is used, then no drain wires are present and the shields of the coaxial wires are connected to the ground pins.
- Pin A5 (CC) of the USB Type-C plug shall be connected to VBUS through a resistor R_p ($56\text{ k}\Omega \pm 5\%$). See Section 4.5.3.2.2 and Table 4-20 for the functional description and value of R_p .
- Contacts B6 and B7 should not be present in the USB Type-C plug.
- All VBUS pins shall be connected together within the USB Type-C plug. A bypass capacitor is required between the VBUS and ground pins in the USB Type-C plug side of the cable. The bypass capacitor shall be $10\text{nF} \pm 20\%$ in cables which incorporate a USB Standard-A plug. The bypass capacitor shall be placed as close as possible to the power supply pad.
- All Ground return pins shall be connected together within the USB Type-C plug.
- Shield and GND grounds shall be connected within the USB Type-C and [USB 3.1](#) Standard-A plugs on both ends of the cable assembly.
- All USB Type-C plug pins that are not listed in this table shall be open (not connected).

3.5.2 USB Type-C to [USB 2.0](#) Standard-A Cable Assembly

Figure 3-25 shows a USB Type-C to [USB 2.0](#) Standard-A cable assembly.

Figure 3-25 USB Type-C to [USB 2.0](#) Standard-A Cable Assembly

Table 3-13 defines the wire connections for the USB Type-C to [USB 2.0](#) Standard-A cable assembly.

Table 3-13 USB Type-C to [USB 2.0](#) Standard-A Cable Assembly Wiring

USB Type-C Plug		Wire		USB 2.0 Standard-A plug	
Pin	Signal Name	Wire Number	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	1	GND_PWRrt1	4	GND
A4, B4, A9, B9	VBUS	2	PWR_VBUS1	1	VBUS
A5	CC	See Note 1

Shell	Shield	<u>BraidOut er Shield</u>	Shield	Shell	Shield

Notes:

1. Pin A5 (CC) of the USB Type-C plug shall be connected to GND through a resistor Rd ($5.1\text{ k}\Omega \pm 20\%$). See Section 4.5.3.2.1 and Table 4-21 for the functional description and value of Rd.
2. This table is based on the assumption that shielded twisted pair is used for all SDP's and there are drain wires. If coaxial wire construction is used, then no drain wires are present and the shields of the coaxial wires are connected to the ground pins.
3. Contacts B6 and B7 should not be present in the USB Type-C plug.
4. All VBUS pins shall be connected together within the USB Type-C plug. A bypass capacitor is required between the VBUS and ground pins in the USB Type-C plug side of the cable. The bypass capacitor shall be $10\text{nF} \pm 20\%$ in cables which incorporate a USB Standard-B plug. The bypass capacitor shall be placed as close as possible to the power supply pad.
5. All Ground return pins shall be connected together within the USB Type-C plug.
6. Shield and GND grounds shall be connected within the USB Type-C and [USB 3.1](#) Standard-B plugs on both ends of the cable assembly.
- 6-7. All USB Type-C plug pins that are not listed in this table shall be open (not connected).

3.5.4 USB Type-C to [USB 2.0](#) Standard-B Cable Assembly

Figure 3-27 shows a USB Type-C to [USB 2.0](#) Standard-B cable assembly.

Figure 3-27 USB Type-C to [USB 2.0](#) Standard-B Cable Assembly

Table 3-15 defines the wire connections for the USB Type-C to [USB 2.0](#) Standard-B cable assembly.

Table 3-15 USB Type-C to [USB 2.0](#) Standard-B Cable Assembly Wiring

				4	ID
Shell	Shield	<u>BraidOut er shield</u>	Shield	Shell	Shield

Notes:

1. Pin A5 (CC) of the USB Type-C plug shall be connected to GND through a resistor Rd ($5.1\text{ k}\Omega \pm 20\%$). See Section 4.5.3.2.1 and Table 4-21 for the functional description and value of Rd.
2. Contacts B6 and B7 should not be present in the USB Type-C plug.
3. All VBUS pins shall be connected together within the USB Type-C plug. Bypass capacitors are not required for the VBUS pins in this cable.
4. All Ground return pins shall be connected together within the USB Type-C plug.
5. Pin 4 (ID) of the [USB 2.0](#) Micro-B plug shall be terminated as defined in the applicable specification for the cable type.
6. Shield and GND grounds shall be connected within the USB Type-C and [USB 2.0](#) Micro-B plugs on both ends of the cable assembly.
- 6-7. All USB Type-C plug pins that are not listed in this table shall be open (not connected).

3.6 Legacy Adapter Assemblies

To enable interoperability between USB Type-C-based products and legacy USB products, the following standard legacy adapter assemblies are defined. Only the adapter assemblies defined in this specification are allowed.

3.6.1 USB Type-C to [USB 3.1](#) Standard-A Receptacle Adapter Assembly

Figure 3-31 shows a USB Type-C to [USB 3.1](#) Standard-A receptacle adapter assembly. This cable assembly is defined for direct connect to a USB device (e.g., a thumb drive). System functionality of using this adaptor assembly together with another USB cable assembly is not guaranteed.

Figure 3-31 USB Type-C to [USB 3.1](#) Standard-A Receptacle Adapter Assembly

Table 3-19 defines the wire connections for the USB Type-C to [USB 3.1](#) Standard-A receptacle adapter assembly.

Table 3-19 USB Type-C to [USB 3.1](#) Standard-A Receptacle Adapter Assembly Wiring

USB Type-C Plug		USB 3.1 Standard-A receptacle	
Pin	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	4 7	GND GND_DRAIN
A4, B4, A9, B9	VBUS	1	VBUS
A5	CC	See Note 1	
B5	VCONN

A7	Dn1	2	D-
A2	SSTXp1	9	StdA_SSTX+
A3	SSTXn1	8	StdA_SSTX-
B11	SSRXp1	6	StdA_SSRX+
B10	SSRXn1	5	StdA_SSRX-
Shell	Shield	Shell	Shield

Notes:

1. Pin A5 (CC) of the USB Type-C plug shall be connected to GND through a resistor R_d ($5.1\text{ k}\Omega \pm 20\%$). See Section 4.5.3.2.1 and Table 4-21 for the functional description and value of R_d .
2. This table is based on the assumption that shielded twisted pair is used for all SDP's and there are drain wires. If coaxial wire construction is used, then no drain wires are present and the shields of the coaxial wires are connected to the ground pins.
3. Contacts B6 and B7 should not be present in the USB Type-C plug.
4. All VBUS pins shall be connected together within the USB Type-C plug. A 10 nF bypass capacitor is required for the VBUS pin in the USB Type-C plug end of the cable. The bypass capacitor should be placed as close as possible to the power supply pad. A bypass capacitor is not required for the VBUS pin in the Standard-A receptacle.
5. All Ground return pins shall be connected together within the USB Type-C plug.
6. All USB Type-C plug pins that are not listed in this table shall be open (not connected).

3.6.2 USB Type-C to [USB 2.0](#) Micro-B Receptacle Adapter Assembly

Figure 3-31 shows a USB Type-C to [USB 2.0](#) Micro-B receptacle adapter assembly.

Figure 3-32 USB Type-C to [USB 2.0](#) Micro-B Receptacle Adapter Assembly

Table 3-19 defines the wire connections for the USB Type-C to [USB 2.0](#) Micro-B receptacle adapter assembly.

Table 3-20 USB Type-C to [USB 2.0](#) Micro-B Receptacle Adapter Assembly Wiring

USB Type-C Plug		USB 2.0 Micro-B receptacle	
Pin	Signal Name	Pin	Signal Name
A1, B1, A12, B12	GND	5	GND
A4, B4, A9, B9	VBUS	1	VBUS
A5	CC	See Note 1	
A6	Dp1	3	D+
A7	Dn1	2	D-
		4	ID
Shell	Shield	Shell	Shield

Notes:

1. Pin A5 (CC) of the USB Type-C plug shall be connected to VBUS through a resistor Rp ($56\text{ k}\Omega \pm 5\%$). See Section 4.5.3.2.2 and Table 4-20 for the functional description and value of Rp.
2. Contacts B6 and B7 should not be present in the USB Type-C plug.
3. All VBUS pins shall be connected together within the USB Type-C plug. Bypass capacitors are not required for the VBUS pins at the Micro-B receptacle end of this cable.
4. All Ground return pins shall be connected together within the USB Type-C plug.
5. All USB Type-C plug pins that are not listed in this table shall be open (not connected).

3.7 Electrical Characteristics

This section defines the USB Type-C raw cable, connector, and cable assembly electrical requirements, including signal integrity, shielding effectiveness, and DC requirements. Chapter 4 defines additional requirements regarding functional signal definition, host/device discovery and configuration, and power delivery.

Unless otherwise specified, all measurements are made at a temperature of 15° to 35° C, a relative humidity of 25% to 85%, and an atmospheric pressure of 86 to 106 kPa and all S-parameters are normalized with an 85 Ω differential impedance.

3.7.1 Raw Cable (Informative)

Informative raw cable electrical performance targets are provided to help cable assembly manufacturers manage the procurement of raw cable. These targets are not part of the USB Type-C compliance requirements. The normative requirement is that the cable assembly meets the performance characteristics specified in Sections 3.7.2, 3.7.4, and 3.7.4.3.

The differential characteristic impedance for shielded differential pairs is recommended to be $90 \Omega \pm 5 \Omega$. The single-ended characteristic impedance of coaxial wires is recommended to be $45 \Omega \pm 3 \Omega$. The impedance should be evaluated using a 200 ps (10%-90%) rise time; a faster rise time is not necessary for raw cable since it will make cable test fixture discontinuities more prominent.

3.7.1.1 Intra-Pair Skew (Informative)

The intra-pair skew for a differential pair is recommended to be less than 10 ps/m. It should be measured with a Time Domain Transmission (TDT) in a differential mode using a 200 ps (10%-90%) rise time with a crossing at 50% of the input voltage.

3.7.1.2 Differential Insertion Loss (Informative)

Cable loss depends on wire gauges, plating and dielectric materials. Table 3-21 and Table 3-22 show examples of differential insertion losses.

Table 3-21 Differential Insertion Loss Examples for USB SuperSpeed with Twisted Pair Construction

Frequency	34AWG	32AWG	30AWG	28AWG
0.625 GHz	-1.8 dB/m	-1.4 dB/m	-1.2 dB/m	-1.0 dB/m
1.25 GHz	-2.5 dB/m	-2.0 dB/m	-1.7 dB/m	-1.4 dB/m
2.50 GHz	-3.7 dB/m	-2.9 dB/m	-2.5 dB/m	-2.1 dB/m
5.00 GHz	-5.5 dB/m	-4.5 dB/m	-3.9 dB/m	-3.1 dB/m
7.50 GHz	-7.0 dB/m	-5.9 dB/m	-5.0 dB/m	-4.1 dB/m
10.00 GHz	-8.4 dB/m	-7.2 dB/m	-6.1 dB/m	-4.8 dB/m
12.50 GHz	-9.5 dB/m	-8.2 dB/m	-7.3 dB/m	-5.5 dB/m
15.00 GHz	-11.0 dB/m	-9.5 dB/m	-8.7 dB/m	-6.5 dB/m

Table 3-22 Differential Insertion Loss Examples for USB SuperSpeed with Coaxial Construction

Frequency	34AWG	32AWG	30AWG	28AWG
0.625 GHz	-1.8 dB/m	-1.5 dB/m	-1.2 dB/m	-1.0 dB/m
1.25 GHz	-2.8 dB/m	-2.2 dB/m	-1.8 dB/m	-1.3 dB/m
2.50 GHz	-4.2 dB/m	-3.4 dB/m	-2.7 dB/m	-1.9 dB/m
5.00 GHz	-6.1 dB/m	-4.9 dB/m	-4.0 dB/m	-3.1 dB/m
7.50 GHz	-7.6 dB/m	-6.5 dB/m	-5.2 dB/m	-4.2 dB/m
10.0 GHz	-8.8 dB/m	-7.6 dB/m	-6.1 dB/m	-4.9 dB/m
12.5 GHz	-9.9 dB/m	-8.6 dB/m	-7.1 dB/m	-5.7 dB/m
15.0 GHz	-12.1 dB/m	-10.9 dB/m	-9.0 dB/m	-6.5 dB/m

3.7.2 USB Type-C to Type-C Passive Cable Assemblies (Normative)

A USB Type-C to Type-C cable assembly shall be tested using a test fixture with the receptacle tongue fabricated in the test fixture. This is illustrated in Figure 3-33. The USB Type-C receptacles are not present in the test fixture. Hosts and devices should account for the additional signal degradation the receptacle introduces.

The requirements are for the entire signal path of the cable assembly mated with the fixture PCB tongues, not including lead-in PCB traces. As illustrated in Figure 3-33, the measurement is between TP1 (test point 1) and TP2 (test point 2). Refer to documentation located at [Cable Assembly and Connector Test Requirements](#) page on the [USB-IF](#) website for a detailed description of a standardized test fixture.

Figure 3-33 Illustration of Test Points for a Mated Cable Assembly

The cable assembly requirements are divided into informative and normative requirements. The informative requirements are provided as design targets for cable assembly manufacturers. The normative requirements are the pass/failure criteria for cable assembly compliance.

3.7.2.1 Recommended USB SuperSpeed Passive Cable Assembly Characteristics**3.7.2.1.1 Differential Insertion Loss (Informative)**

Figure 3-34 shows the differential insertion loss limit for a [USB 3.1](#) Gen 2 Type-C cable assembly, which is defined by the following vertices: (100 MHz, -2 dB), (2.5 GHz, -4 dB), (5.0 GHz, -6 dB), (10 GHz, -11 dB) and (15 GHz, -20 dB).

Figure 3-34 Recommended Differential Insertion Loss Requirement

3.7.2.1.2 Differential Return Loss (Informative)

Figure 3-35 shows the differential return loss limit, which is defined by the following points: (100 MHz, -18 dB), (5 GHz, -18 dB), (10 GHz, -12 dB), and (15 GHz, -5 dB).

Figure 3-35 Recommended Differential Return Loss Requirement

3.7.2.1.3 Differential Near-End and Far-End Crosstalk between SuperSpeed Pairs (Informative)

Both the near-end crosstalk (DDNEXT) and far-end crosstalk (DDFEXT) are specified, as shown in Figure 3-36. The DDNEXT/DDFEXT limits are defined by the following vertices: (100 MHz, -37 dB), (5 GHz, -37 dB), (10 GHz, -32 dB), and (15 GHz, -25 dB).

Figure 3-36 Recommended Differential Crosstalk Requirement

3.7.2.1.4 Differential Crosstalk between USB D+/D- and USB SuperSpeed Pairs (Informative)

The differential near-end and far-end crosstalk between the USB D+/D- pair and the USB SuperSpeed pairs should be managed not to exceed the limits shown in Figure 3-37. The limits are defined by the following points: (100 MHz, -35 dB), (5 GHz, -35 dB), and (7.5 GHz, -30 dB).

Figure 3-37 Recommended Differential Near-End and Far-End Crosstalk Requirement between USB D+/D- Pair and USB SuperSpeed Pair

3.7.2.2 Normative SuperSpeed Passive Cable Assembly Requirements

The integrated parameters are used for cable assembly compliance (except for insertion loss and differential-to-common-mode conversion) to avoid potential rejection of a functioning cable assembly that may fail the traditional S-parameters spec at a few frequencies.

3.7.2.2.1 Insertion Loss Fit at Nyquist Frequencies (Normative)

The insertion loss fit at Nyquist frequency measures the attenuation of the cable assembly. To obtain the insertion loss fit at Nyquist frequency, the measured cable assembly differential insertion loss is fitted with a smooth function. A standard fitting algorithm and tool shall be used to extract the insertion loss fit at Nyquist frequencies. Refer to documentation located at [Cable Assembly and Connector Test Requirements](#) page on the [USB-IF](#) website for a more detailed description about insertion loss fit. Figure 3-38 illustrates an example of a measured cable assembly insertion loss fitted with a smooth function; the insertion loss fit at the Nyquist frequency of USB SuperSpeed Gen 2 (5.0 GHz) is -5.8 dB.

Figure 3-38 Illustration of Insertion Loss Fit at Nyquist Frequency

The insertion loss fit at Nyquist frequency ($IL_{fitatNq}$) shall meet the following requirements:

- ≥ -4 dB at 2.5 GHz,
- ≥ -6 dB at 5 GHz, and
- ≥ -11 dB at 10 GHz.

2.5 GHz, 5.0 GHz and 10 GHz are the Nyquist frequencies for USB SuperSpeed Gen 1, USB SuperSpeed Gen 2, and a possible future 20 Gbps USB data rate, respectively.

The USB SuperSpeed Gen 1-only Type-C to Type-C cable assembly is allowed by this specification and shall comply with the following insertion loss fit at Nyquist frequency requirements:

- ≥ -7.0 dB at 2.5 GHz, and
- > -12 dB at 5 GHz.

This insertion fit at Nyquist frequency allows the USB SuperSpeed Gen 1-only Type-C to Type-C cable assembly to achieve an overall length of approximately 2 meters.

3.7.2.2.2 Integrated Multi-reflection (Normative)

The insertion loss deviation, ILD, is defined as

$$ILD(f) = IL(f) - ILfit(f)$$

It measures the ripple of the insertion loss, caused by multiple reflections inside the cable assembly (mated with the fixture). The integration of $ILD(f)$ is called the integrated multi-reflection (IMR):

$$IMR = dB \left(\sqrt{\frac{\int_0^{f_{max}} |ILD(f)|^2 |Vin(f)|^2 df}{\int_0^{f_{max}} |Vin(f)|^2 df}} \right)$$

where $f_{max} = 12.5$ GHz and $Vin(f)$ is the input trapezoidal pulse spectrum, defined in Figure 3-39.

Figure 3-39 Input Pulse Spectrum

IMR has dependency on $ILfitatNq$. More IMR may be tolerated when $ILfitatNq$ decreases. The IMR limit is specified as a function of $ILfitatNq$:

$$IMR \leq 0.126 \cdot ILfitatNq^2 + 3.024 \cdot ILfitatNq - 23.392.$$

This is plotted in Figure 3-40.

Figure 3-40 IMR Limit as Function of ILfitatNq**3.7.2.2.3 Integrated Crosstalk between SuperSpeed Pairs (Normative)**

The integrated crosstalk between all USB SuperSpeed pairs is calculated with the following equations:

INEXT

$$= dB \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|NEXT(f)|^2 + 0.125^2 \cdot |C2D(f)|^2) df + |V_{dd}(f)|^2 + |NEXTd(f)|^2 |NEXTd(f)|^2 df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right)_{INEXT}$$

IFEXT

$$\begin{aligned} &= dB \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|FEXT(f)|^2 + 0.125^2 \cdot |C2D(f)|^2) df + |V_{dd}(f)|^2 + |FEXTd(f)|^2 |FEXTd(f)|^2 df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right)_{IFEXT} \\ &= dB \left(\sqrt{\frac{\int_0^{f_{max}} (|V_{in}(f)|^2 (|FEXT(f)|^2 + 0.125^2 \cdot |C2D(f)|^2) + |V_{dd}(f)|^2 + |FEXTd(f)|^2 |FEXTd(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right) \end{aligned}$$

where $NEXT(f)$, $FEXT(f)$, and $C2D(f)$ are the measured near-end and far-end crosstalk between USB SuperSpeed pairs, and the common-mode-to-differential conversion, respectively. The factor of 0.125^2 accounts for the assumption that the common mode amplitude is 12.5% of the differential amplitude. $NEXTd(f)$ and $FEXTd(f)$ are, respectively, the near-end and far-end crosstalk from the D+/D- pair to SuperSpeed pairs. $V_{dd}(f)$ is the input pulse spectrum evaluated using the equation in Figure 3-39 with $T_b=2.08$ ns.

The integration shall be done for each NEXT and FEXT between all differential pairs. The largest values of INEXT and IFEXT shall meet the following requirements:

- $INEXT \leq -40$ dB to 12.5GHz, for TX1 to RX1, TX2 to RX2, TX1 to RX2, TX2 to RX1, TX1 to TX2, and RX1 to RX2,
- $IFEXT \leq -40$ dB to 12.5GHz, for TX1 to RX1, TX2 to RX2, TX1 to RX2, TX2 to RX1, TX1 to TX2, and RX1 to RX2.

The port-to-port crosstalk (TX1 to RX2, TX2 to RX1, TX1 to TX2, and RX1 to RX2) is specified to support the usages in which all the four SuperSpeed pairs transmit or receive signals simultaneously, for example in an Alternate Mode.

Crosstalk from the USB SuperSpeed pairs to USB 2.0 D+/D- shall be controlled to ensure the robustness of the USB 2.0 link. Since USB Type-C to Type-C Full-Featured cable assemblies may support the usage of USB SuperSpeed or an alternate mode (e.g., DisplayPort), the crosstalk from the four high speed differential pairs to D+/D- may be from near-end crosstalk, far-end crosstalk, or a combination of the two. The integrated crosstalk to D+/D- is calculated with the following equations:

$$\text{IDDXT_1NEXT + FEXT} = dB \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|NEXT1(f)|^2 + |V_{in}(f)|^2 + |FEXT(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right) \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|NEXT1(f)|^2 + |FEXT(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right)$$

where:

NEXT = Near-end crosstalk from USB SuperSpeed TX pair to D+/D-

FEXT = Far-end crosstalk from USB SuperSpeed RX pair to D+/D-

fmax = 1.2 GHz

$$\text{IDDXT_2NEXT} = dB \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|NEXT1(f)|^2 + |V_{in}(f)|^2 + |NEXT2(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right) \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 (|NEXT1(f)|^2 + |NEXT2(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right)$$

where:

NEXT1 = Near-end crosstalk from USB SuperSpeed TX pair to D+/D-

NEXT2 = Near-end crosstalk from USB SuperSpeed RX (the RX functioning in TX mode) pair to D+/D-

fmax = 1.2 GHz

The integration shall be done for NEXT + FEXT and 2NEXT on D+/D- from the two differential pairs located at A2, A3, B10 and B11 (see Figure 2-2) and for NEXT + FEXT and 2NEXT on D+/D- from the two differential pairs located at B2, B3 A10 and A11 (see Figure 2-2). Measurements are made in two sets to minimize the number of ports required for each measurement. The integrated differential crosstalk on D+/D- shall meet the following requirements:

- IDDXT_1NEXT + FEXT ≤ -34.5 dB,
- IDDXT_2NEXT ≤ -33 dB.

3.7.2.2.4 Integrated Return Loss (Normative)

The integrated return loss (IRL) manages the reflection between the cable assembly and the rest of the system (host and device). It is defined as:

$$IRL = dB \left(\sqrt{\frac{\int_0^{f_{max}} |V_{in}(f)|^2 |SDD21(f)|^2 (|SDD11(f)|^2 + |SDD22(f)|^2) df}{\int_0^{f_{max}} |V_{in}(f)|^2 df}} \right)$$

where *SDD21(f)* is the measured cable assembly differential insertion loss, *SDD11(f)* and *SDD22(f)* are the measured cable assembly return losses on the left and right sides, respectively, of a differential pair.

The IRL also has a strong dependency on ILfitatNq, and its limit is specified as a function of ILfitatNq:

$$IRL \leq 0.046 \cdot ILfitatNq^2 + 1.812 \cdot ILfitatNq - 10.784.$$

It is shown in Figure 3-41.

Figure 3-41 IRL Limit as Function of ILfitatNq

3.7.2.2.5 Differential-to-Common-Mode Conversion (Normative)

The differential-to-common-mode conversion is specified to control the injection of common mode noise from the cable assembly into the host or device. Figure 3-42 illustrates the differential-to-common mode conversion (SCD12/SCD21) requirement. A mated cable assembly passes if its SCD12/SCD21 is less than or equal to -20 dB from 100 MHz to 10 GHz.

Figure 3-42 Differential-to-Common-Mode Conversion Requirement

3.7.2.3 Low-Speed Signal Requirements (Normative)

This section specifies the electrical requirements for CC and SBU wires and the coupling among CC, USB D+/D-, VBUS and SBU.

The CC and SBU wires may be unshielded or shielded, and shall have the properties specified in Table 3-23.

Table 3-23 Electrical Requirements for CC and SBU wires

Name	Description	Min	Max	Units
zCable_CC	Cable characteristic impedance on the CC wire	32	93	Ω
rCable_CC	Cable DC resistance on the CC wire		15	Ω
tCableDelay_CC	Cable propagation delay on the CC wire		26	ns
cCablePlug_CC	Capacitance for each cable plug on the CC wire		25	pF
zCable_SBU	Cable characteristic impedance on the SBU wires	32	53	Ω
tCableDelay_SBU	Cable propagation delay on the SBU wires		26	ns
rCable_SBU	<u>DC resistance of SBU wires in the cable</u>		<u>5</u>	<u>Ω</u>
SBU_SE Insertion Loss	<u>Cable SBU single-ended insertion loss</u>		<u>2.0 @ 0.5 MHz</u> <u>4.0 @ 1 MHz</u> <u>9.0 @ 10 MHz</u> <u>10.7 @ 25 MHz</u> <u>11.9 @ 50 MHz</u> <u>13.0 @ 100 MHz</u>	<u>dB</u>

Coupling or crosstalk, both near-end and far-end, among the low speed signals shall be controlled. Table 3-24 shows the matrix of couplings specified.

Table 3-24 Coupling Matrix for Low Speed Signals

Coupling Matrix	D- (SE)	D+/D- (DF)	VBUS	SBU_B/SBU_A (SE)
CC	FF, CT	FF, CT	FF, CT	FF
D+/D- (DF)	N/A	N/A	FF, CT	FF
SBU_A/SBU_B	N/A	FF	FF	FF

DF: Differential; FF: Full-featured cable; CT: Charge-through cable (including USB 2.0 function).

3.7.2.3.1 CC to USB D+/D- (Normative)

The differential coupling between the CC and D+/D- shall be below the limit shown in Figure 3-43. The limit is defined with the vertices of (0.3 MHz, -60.5 dB), (1 MHz, -50 dB), (10 MHz, -30 dB), (16 MHz, -26 dB) and (100 MHz, -26 dB).

Figure 3-43 Requirement for Differential Coupling between CC and D+/D-

For USB 2.0 Type-C cables, the singled-ended coupling between the CC and D- shall be below the limit shown in Figure 3-44. The limit is defined with the vertices of (0.3 MHz, -48.5 dB), (1 MHz, -38 dB), (10 MHz, -18 dB) and (100 MHz, -18 dB).

Figure 3-44 Requirement for Single-Ended Coupling between CC and D- in USB 2.0 Type-C Cables

For USB Full-Featured Type-C cables, the singled-ended coupling between the CC and D- shall be below the limit shown in Figure 3-45. The limit is defined with the vertices of (0.3 MHz, -8 dB), (10 MHz, -27.5 dB), (11.8 MHz, -26 dB) and (100 MHz, -26 dB).

Figure 3-45 Requirement for Single-Ended Coupling between CC and D- in USB Full-Featured Type-C Cables**3.7.2.3.2 VBUS Coupling to SBU_A/SBU_B, CC, and USB D+/D- (Normative)**

The differential coupling between VBUS and USB D+/D- shall be less than the limit shown in Figure 3-46. The limit is defined by the following vertices: (0.3 MHz, -40 dB), (1 MHz, -40 dB), (30 MHz, -40 dB), and (100 MHz, -30 dB).

Figure 3-46 Requirement for Differential Coupling between VBUS and D+/D-

The ~~maximum VBUS loop inductance of VBUS and its coupling factor to low speed lines is controlled to limit noise induced on low speed signaling lines. The maximum loop inductance of VBUS~~ shall be 900 nH and the maximum mutual inductance ~~coupling factor f_{k(M)}~~ between VBUS and low speed signal lines (CC, SBU_A, SBU_B, D+, D-) shall be as

specified in Table 3-25 to limit VBUS inductive noise coupling on low speed signal lines. For fully full-featured cables, the range of VBUS bypass capacitance shall be 8nF up to 500nF as any of the values in the range is equally effective for high-speed return-path bypassing.

Table 3-25 Maximum Mutual Inductance (M) between VBUS and Low Speed Signal Lines

Low Speed Wire	Max Mutual Inductance (nH)
<u>CC</u>	<u>350</u>
<u>SBU_A, SBU_B</u>	<u>330</u>
<u>D+, D-</u>	<u>330</u>

3.7.2.3.3 Coupling between SBU_A and SBU_B (Normative)

The single-ended coupling between SBU_A and SBU_B shall be less than the limit shown in Figure 3-47. The limit is defined with the vertices of (0.3 MHz, -56.5 dB), (1 MHz, -46 dB), (10 MHz, -26 dB), (11.2 MHz, -25 dB), and (100 MHz, -25 dB).

Figure 3-47 Requirement for Single-Ended Coupling between SBU_A and SBU_B

3.7.2.3.4 Coupling between SBU_A/SBU_B and CC (Normative)

The single-ended coupling between SBU_A and CC, and between SBU_B and CC shall be less than the limit shown in Figure 3-48. The limit is defined with the vertices of (0.3 MHz, -65 dB), (1 MHz, -55 dB), (18 MHz, -30 dB), and (100 MHz, -30 dB).

Figure 3-48 Requirement for Single-Ended Coupling between SBU_A/SBU_B and CC

3.7.2.3.5 Coupling between SBU_A/SBU_B and USB D+/D- (Normative)

The coupling between SBU_A and differential D+/D-, and between SBU_B and differential D+/D- shall be less than the limit shown in Figure 3-49. The limit is defined with the vertices of (0.3 MHz, -80 dB), (30 MHz, -40 dB), and (100 MHz, -40 dB).

Figure 3-49 Requirement for Coupling between SBU_A and differential D+/D-, and SBU_B and differential D+/D-

3.7.2.4 USB D+/D- Signal Requirements (Normative)

The USB D+/D- lines of the USB Type-C to USB Type-C passive cable assembly shall meet the requirements defined in Table 3-26.

Table 3-26 USB D+/D- Signal Integrity Requirements for USB Type-C to USB Type-C Passive Cable Assemblies

Items	Descriptions and Procedures	Requirements
Differential Impedance	EIA 364-108 This test ensures that the D+/D- lines of the cable assembly have the proper impedance. For the entire cable assembly.	75 ohms min and 105 ohms max. 400 ps rise time (20%-80%).
Propagation Delay	EIA 364-103 The purpose of the test is to verify the end-to-end propagation of the D+/D- lines of the cable assembly.	26 ns max. 400 ps rise time (20%-80%).
Intra-pair Skew	EIA 364 – 103 This test ensures that the signal on both the D+ and D- lines of cable assembly arrive at the receiver at the same time.	100 ps max. 400 ps rise time (20%-80%).
D+/D- Pair Attenuation	EIA 364 – 101 This test ensures the D+/D- pair of a cable assembly is able to provide adequate signal strength to the receiver in order to maintain a low error rate.	≥ -1.02 dB @ 50 MHz ≥ -1.43 dB @ 100 MHz ≥ -2.40 dB @ 200 MHz ≥ -4.35 dB @ 400 MHz
<u>D+ or D- DC Resistance</u>	<u>This test ensures the D+/D- has the proper DC resistance range in order to predict the EOP level and set the USB 2.0 disconnect level.</u>	<u>3.5 ohms max.</u>

3.7.2.5 VBUS DC Voltage Tolerance (Normative)

A USB Type-C to USB Type-C cable assembly shall tolerate a VBUS voltage of 21 V DC at the cable rated current (i.e. 3 A or 5 A) applied for one hour as a pre-condition of the testing of the electrical aspects of the cable assembly.

3.7.3 Mated Connector (Informative)

The mated connector as defined in this specification for USB Type-C consists of a receptacle mounted on a PCB, representing how the receptacle is used in a product, and a test plug also mounted on a PCB (paddle card) without cable. This is illustrated in Figure 3-50. Note that the test plug is used in host/device TX/RX testing also.

Figure 3-50 Illustration of USB Type-C Mated Connector

3.7.3.1 Differential Impedance (Informative)

The mated connector impedance target is specified to minimize reflection from the connector. The differential impedance of a mated connector should be within $85 \Omega \pm 9 \Omega$, as seen from a 40 ps (20% – 80%) rise time. The impedance profile of a mated connector should fall within the limits shown in Figure 3-51.

Figure 3-51 Recommended Impedance Limits of a USB Type-C Mated Connector

The PCB stack up, lead geometry, and solder pad geometry should be modeled in 3D field-solver to optimize electrical performance. Example ground voids under signal pads are shown in Figure 3-52 based on pad geometry, mounting type, and PCB stack-up shown.

Figure 3-52 Recommended Ground Void Dimensions for USB Type-C Receptacle

3.7.3.2 Mated Connector Recommended Differential S-Parameter and Signal Integrity Characteristics (Informative)

The recommended signal integrity characteristics of USB Type-C mated connector pair are listed in Table 3-27.

Table 3-27 USB Type-C Mated Connector Recommended Signal Integrity Characteristics (Informative)

Items	Descriptions and Procedures	Requirements
Differential Insertion Loss Fit at Nyquist Frequencies (ILfitatNq)	ILfitatNq is evaluated at both the SuperSpeed Gen 1, Gen 2 and future 20 Gbps generation Nyquist frequencies.	$\geq -0.6 \text{ dB} @ 2.5 \text{ GHz}$ $\geq -0.8 \text{ dB} @ 5.0 \text{ GHz}$ $\geq -1.0 \text{ dB} @ 10 \text{ GHz}$
Integrated Differential Multi-reflection (IMR)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} ILD(f) ^2 Vin(f) ^2 df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	$\leq -40 \text{ dB}$

Items	Descriptions and Procedures	Requirements
Integrated Differential Near-end Crosstalk on SuperSpeed (INEXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} Vin(f) ^2 (NEXT(f) ^2 + 0.125^2 \cdot C2D(f) ^2) df + Vdd(f) ^2 NEXTd(f) ^2 df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right) dB$ <p>where: $NEXT =$ NEXT between SuperSpeed pairs $NEXTd =$ NEXT between D+/D- and SuperSpeed pairs</p>	≤ -44 dB
Integrated Differential Far-end Crosstalk on SuperSpeed (IFEXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} Vin(f) ^2 (FEXT(f) ^2 + 0.125^2 \cdot C2D(f) ^2) df + Vdd(f) ^2 FEXTd(f) ^2 df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right) dB$ <p>where: $FEXT =$ NEXT between SuperSpeed pairs $FEXTd =$ NEXT between D+/D- and SuperSpeed pairs</p>	≤ -44 dB
Differential Crosstalk on D+/D-	The differential near-end and far-end crosstalk between the D+/D- pair and the SuperSpeed pairs in mated connectors.	See Figure 3-53
Integrated Return Loss (IRL)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} Vin(f) ^2 SDD21(f) ^2 (SDD11(f) ^2 + SDD22(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	≤ -18 dB
Differential to Common Mode Conversion (SCD12 and SCD21)	<p>The differential to common mode conversion is specified to control the injection of common mode noise from the cable assembly into the host or device. Frequency range: 100 MHz ~ 10.0 GHz</p>	See Figure 3-54

Note: $f_{max} = 12.5$ GHz (unless otherwise specified);

$Vin(f)$ is defined in Figure 3-39 with T_b (UI) = 100 ps;

$Vdd(f)$ is also defined in Figure 3-39 with T_b (UI) = 2.08 ns.

$C2D(f)$ = measured near-end and far-end crosstalk between USB SuperSpeed pairs, and the common-mode-to-differential conversion, respectively. The factor of 0.125^2 accounts for the assumption that the common mode amplitude is 12.5% of the differential amplitude

Figure 3-53 Recommended Differential Near-End and Far-End Crosstalk Limits between D+/D- Pair and SuperSpeed Pairs

Figure 3-54 Recommended Limits for Differential-to-Common-Mode Conversion

3.7.4 USB Type-C to Legacy Cable Assemblies (Normative)

The USB Type-C to legacy cable assemblies may support [USB 2.0](#) only or [USB 3.1](#) Gen 2; [USB 3.1](#) Gen 1-only Type-C to legacy cable assemblies are not allowed.

3.7.4.1 USB 2.0-only Cable Assemblies (Normative)

The [USB 2.0](#)-only Type-C to legacy USB cable assemblies include:

- USB Type-C plug to [USB 2.0](#) Standard-A plug
- USB Type-C plug to [USB 2.0](#) Standard-B plug
- USB Type-C plug to [USB 2.0](#) Micro-B plug
- USB Type-C plug to [USB 2.0](#) Mini-B plug

The USB D+/D- signal integrity requirements are specified in Table 3-28.

Table 3-28 USB D+/D- Signal Integrity Requirements for USB Type-C to Legacy USB Cable Assemblies

Items	Descriptions and Procedures	Requirements
Differential Impedance	EIA 364-108 This test ensures that the D+/D- lines of the cable assembly have the proper impedance. For the entire cable assembly.	75 ohms min and 105 ohms max. 400 ps rise time (20%-80%).
Propagation Delay	EIA 364-103 The purpose of the test is to verify the end-to-end propagation of the D+/D- lines of the cable assembly.	10 ns max for USB Type-C to Micro-B cable assembly; 20 ns max for all other USB Type-C to legacy USB cable assemblies. 400 ps rise time (20%-80%).
Intra-pair Skew	EIA 364 – 103 This test ensures that the signal on both the D+ and D- lines of cable assembly arrive at the receiver at the same time.	100 ps max. 400 ps rise time (20%-80%).
D+/D- Pair Attenuation	EIA 364 – 101 This test ensures the D+/D- pair of a cable assembly is able to provide adequate signal strength to the receiver in order to maintain a low error rate.	≥ -1.02 dB @ 50 MHz ≥ -1.43 dB @ 100 MHz ≥ -2.40 dB @ 200 MHz ≥ -4.35 dB @ 400 MHz
<u>D+ or D- DC Resistance</u>	<u>This test ensures the D+/D- has the proper DC resistance range in order to predict the EOP level and set the USB 2.0 disconnect level.</u>	<u>3.5 ohms max.</u>

3.7.4.2 [USB 3.1](#) Gen 2 Cable Assemblies (Normative)

The USB Type-C to [USB 3.1](#) Gen 2 legacy cable assemblies include:

- USB Type-C plug to [USB 3.1](#) Standard-A plug
- USB Type-C plug to [USB 3.1](#) Standard-B plug
- USB Type-C plug to [USB 3.1](#) Micro-B plug

The informative design targets for these cables are provided in Table 3-29.

Table 3-29 Design Targets for USB Type-C to [USB 3.1](#) Gen 2 Legacy Cable Assemblies (Informative)

Items	Design Targets
Differential Impedance	76 ohms min and 96 ohms max. 40 ps rise time (20%-80%).
Differential Insertion Loss	$\geq -2 \text{ dB}$ @ 100 MHz $\geq -4 \text{ dB}$ @ 2.5 GHz, except for the USB Type-C plug to USB 3.1 Standard-A plug cable assembly which is $\geq -3.5 \text{ dB}$ @ 2.5 GHz $\geq -6.0 \text{ dB}$ max @ 5.0 GHz
Differential NEXT between SuperSpeed Pairs	$\leq -34 \text{ dB}$ to 5 GHz
Differential NEXT and FEXT between D+/D- and SuperSpeed Pairs	$\leq -30 \text{ dB}$ to 5 GHz

The normative requirements include the USB D+/D- signaling as specified in Table 3-28, and the USB SuperSpeed parameters specified in Table 3-30.

Table 3-30 USB Type-C to [USB 3.1](#) Gen 2 Legacy Cable Assembly Signal Integrity Requirements (Normative)

Items	Descriptions and Procedures	Requirements
Differential Insertion Loss Fit at Nyquist Frequencies (ILfitatNq)	ILfitatNq is evaluated at both the SuperSpeed Gen 1 and Gen 2 Nyquist frequencies.	$\geq -4 \text{ dB}$ @ 2.5 GHz, except for the USB Type-C plug to USB 3.1 Standard-A plug cable assembly which is $\geq -3.5 \text{ dB}$ @ 2.5 GHz $\geq -6.0 \text{ dB}$ at 5.0 GHz
Integrated Differential Multi-reflection (IMR)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} ILD(f) ^2 Vin(f) ^2 df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	$\leq 0.126 \cdot ILfitatNq^2 + 3.024 \cdot ILfitatNq - 21.392$ See Figure 3-55.
Integrated Differential Crosstalk on SuperSpeed (ISSXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} (Vin(f) ^2 NEXTs(f) ^2 + Vdd(f) ^2 NEXTd(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$ where: $NEXTs$ = NEXT between SuperSpeed pairs $NEXTd$ = NEXT between D+/D- and SuperSpeed pairs $Vdd(f)$ = Input pulse spectrum on D+/D- pair, evaluated using equation shown in Figure 3-39 with T_b (UI) = 2.08 ns.	$\leq -38 \text{ dB}$
Integrated Differential Crosstalk on D+/D- (IDDXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} (Vin(f) ^2 NEXT(f) ^2 + Vin(f) ^2 FEXT(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right) dB$ where: $NEXT$ = Near-end crosstalk from SuperSpeed to D+/D- $FEXT$ = Far-end crosstalk from SuperSpeed to D+/D- $f_{max} = 7.51.2 \text{ GHz}$	$\leq -28.5 \text{ dB}$

Items	Descriptions and Procedures	Requirements
Integrated Return Loss (IRL)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} Vin(f) ^2 SDD21(f) ^2 (SDD11(f) ^2 + SDD22(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	$\leq 0.046 \cdot ILfitatNq^2 + 1.812 \cdot ILfitatNq - 9.784$ See Figure 3-56.
Differential to Common Mode Conversion (SCD12 and SCD21)	The differential to common mode conversion is specified to control the injection of common mode noise from the cable assembly into the host or device. Frequency range: 100 MHz ~ 10.0 GHz	≤ -20 dB

Note: $f_{max} = 10$ GHz (unless otherwise specified); $Vin(f)$ is defined in Figure 3-39 with T_b (UI) = 100 ps; and $Vdd(f)$ is also defined in Figure 3-39 with T_b (UI) = 2.08 ns.

Figure 3-55 IMR Limit as Function of ILfitatNq for USB Type-C to Legacy Cable Assembly

Figure 3-56 IRL Limit as Function of ILfitatNq for USB Type-C to Legacy Cable Assembly

3.7.4.3 Compliant USB Legacy Plugs used in USB Type-C to Legacy Cable Assemblies

The following requirements are incremental to the existing requirements for legacy connectors when used in compliant USB Type-C to legacy cable assemblies.

3.7.4.3.1 Contact Material Requirements for USB Type-C to USB Micro-B Assemblies

For USB Type-C to USB Micro-B assemblies, change the contact material in the USB Micro-B connector to achieve the following Low Level Contact Resistance (EIA 364-23B):

- 20 milliohms (Max) initial for VBUS and GND contacts,
- Maximum change (delta) of +10 milliohms after environmental stresses.

3.7.4.3.2 Contact Current Ratings for USB Standard-A, USB Standard-B and USB Micro-B Connector Mated Pairs (EIA 364-70, Method 2)

When a current of 3 A is applied to the VBUS pin and its corresponding GND pin (i.e., pins 1 and 4 in a USB Standard-A or USB Standard-B connector or pins 1 and 5 in a USB Micro-B connector), the delta temperature shall not exceed +30°C at any point on the connectors under test, when measured at an ambient temperature of 25°C.

3.7.5 USB Type-C to USB Legacy Adapter Assemblies (Normative)

Only the following standard legacy adapter assemblies are defined:

- [USB 2.0](#) Type-C plug to [USB 2.0](#) Micro-B receptacle
- USB Full-Featured Type-C plug to [USB 3.1](#) Standard-A receptacle

3.7.5.1 USB 2.0 Type-C Plug to [USB 2.0](#) Micro-B Receptacle Adapter Assembly (Normative)

This adapter assembly supports only the [USB 2.0](#) signaling. It shall not exceed 150 mm total length, measured from end to end. Table 3-31 defines the electrical requirements.

Table 3-31 USB D+/D- Signal Integrity Requirements for USB Type-C to Legacy USB Adapter Assemblies (Normative)

Items	Descriptions and Procedures	Requirements
Differential Impedance	EIA 364-108 This test ensures that the D+/D- lines of the adapter assembly have the proper impedance. For the entire adaptor assembly.	75 ohms min and 105 ohms max. 400 ps rise time (20%-80%).
Intra-pair Skew	EIA 364 – 103 This test ensures that the signal on both the D+ and D- lines of adapter assembly arrive at the receiver at the same time.	20 ps max. 400 ps rise time (20%-80%).
Differential Insertion Loss	EIA 364 – 101 This test ensures the D+/D- pair of an adapter assembly can provide adequate signal strength to the receiver.	-0.7 dB max @ 400 MHz
<u>D+ or D- DC Resistance</u>	<u>This test ensures the D+/D- has the proper DC resistance range in order to predict the EOP level and set the USB 2.0 disconnect level.</u>	<u>2.5 ohms max.</u>

**3.7.5.2 USB Full-Featured Type-C Plug to [USB 3.1](#) Standard-A Receptacle Adapter Assembly
(Normative)**

The USB Full-Featured Type-C plug to [USB 3.1](#) Standard-A receptacle adapter assembly is intended to be used with a direct-attach device (e.g., USB thumb drive). A system is not guaranteed to function when using an adapter assembly together with a Standard USB cable assembly.

To minimize the impact of the adapter assembly to system signal integrity, the adapter assembly should meet the informative design targets in Table 3-32.

**Table 3-32 Design Targets for USB Type-C to [USB 3.1](#) Standard-A Adapter Assemblies
(Informative)**

Items	Design Targets
Differential Return Loss	≤ -15 dB to 5 GHz Normalized with 85 ohms.
Differential Insertion Loss	≥ -2.4 dB to 2.5 GHz, ≥ -3.5 dB to 5 GHz
Differential NEXT between SuperSpeed Pairs	≤ -40 dB to 2.5 GHz ≤ -34 dB at 5 GHz
Differential NEXT and FEXT between D+/D- and SuperSpeed Pairs	≤ -30 dB to 2.5 GHz

The normative requirements for the adapter assembly are defined in Table 3-31 and Table 3-33. The adapter assembly total length is limited to 150 mm max.

Table 3-33 USB Type-C to [USB 3.1](#) Standard-A Receptacle Adapter Assembly Signal Integrity Requirements (Normative)

Items	Descriptions and Procedures	Requirements
Differential Insertion Loss Fit at Nyquist Frequency (ILfitatNq)	ILfitatNq is evaluated at the SuperSpeed Gen 1 Nyquist frequency.	$\geq -2.4 \text{ dB}$ at 2.5 GHz $\geq -3.5 \text{ dB}$ at 5 GHz
Integrated Differential Multi-reflection (IMR)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} ILD(f) ^2 Vin(f) ^2 df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	$\leq -38 \text{ dB}$, $T_b = 200 \text{ ps}$ $\leq -27 \text{ dB}$, $T_b = 100 \text{ ps}$
Integrated Differential Crosstalk on SuperSpeed (ISSXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} (Vin(f) ^2 NEXTs(f) ^2 + Vdd(f) ^2 NEXTd(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$ where: $NEXTs$ = NEXT between SuperSpeed pairs $NEXTd$ = NEXT between D+/D- and SuperSpeed pairs $Vdd(f)$ = Input pulse spectrum on D+/D- pair, evaluated using equation shown in Figure 3-39 with T_b (UI) = 2.08 ns.	$\leq -37 \text{ dB}$
Integrated Differential Crosstalk on D+/D- (IDDXT)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} (Vin(f) ^2 NEXT(f) ^2 + Vin(f) ^2 FEXT(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right) dB$ where: $NEXT$ = Near-end crosstalk from SuperSpeed to D+/D- $FEXT$ = Far-end crosstalk from SuperSpeed to D+/D- $f_{max} = 1.2 \text{ GHz}$	$\leq -30 \text{ dB}$
Integrated Return Loss (IRL)	$dB \left(\sqrt{\frac{\int_0^{f_{max}} Vin(f) ^2 SDD21(f) ^2 (SDD11(f) ^2 + SDD22(f) ^2) df}{\int_0^{f_{max}} Vin(f) ^2 df}} \right)$	$\leq -14.5 \text{ dB}$, $T_b = 200 \text{ ps}$ $\leq -12.0 \text{ dB}$, $T_b = 100 \text{ ps}$
Diff to Comm mode	Differential to Common Mode conversion (SCD12, SCD21)	$\leq -15 \text{ dB}$

Note: $f_{max} = 7.5 \text{ GHz}$; $Vin(f)$ is defined in Figure 3-39 with T_b (UI) = 200 ps; and $Vdd(f)$ is also specified in Figure 3-39 with T_b (UI) = 2.08 ns.

3.7.5.3 Compliant USB Legacy Receptacles used in USB Type-C to Legacy Adapter Assemblies

3.7.5.3.1 Contact Material Requirements

Refer to Section 3.7.4.3.1 for contact material requirements as these apply to legacy USB Standard-A and USB Micro-B receptacles used in USB Type-C to Legacy Adapter Assemblies.

3.7.5.3.2 Contact Current Ratings

Refer to Section 3.7.4.3.2 for contact current rating requirements as these apply to legacy USB Standard-A and USB Micro-B receptacles used in USB Type-C to Legacy Adapter Assemblies.

3.7.6 Shielding Effectiveness Requirements (Normative)

The cable assembly shielding effectiveness (SE) test measures the EMI and RFI levels from the cable assembly. To perform the measurement, the cable assembly shall be installed in the cable SE test fixture as shown in Figure 3-57. The coupling factors from the cable to the fixture are characterized with a VNA.

Figure 3-57 Cable Assembly Shielding Effectiveness Testing

All USB Type-C cable assemblies shall pass the shielding effectiveness test for compliance. Figure 3-58 shows the pass/fail criteria for the(a) USB Type-C to USB Type-C cable assemblies is shown in a while the pass/fail criteria for the (b) USB Type-C to legacy USB cable assemblies, and (c) the USB Type-C to USB 3.1 is shown in b Standard-A Receptacle Adapter assembly. Note that the shielding effectiveness for the frequency band from 4 GHz to 5 GHz is not specified since there is no antenna operating in this frequency range.

Figure 3-58 Shielding Effectiveness Pass/Fail Criteria

(a) For USB Type-C to USB Type-C Cable Assemblies

(b) For USB Type-C to legacy USB cable assemblies

(a) For USB Type-C to USB Type-C Cable Assemblies

(b) For USB Type-C to legacy USB Cable Assemblies

(c) For USB Type-C to USB3.1 Standard-A Receptacle Adapter Assembly

3.7.7 DC Electrical Requirements (Normative)

Unless otherwise stated, the tests in this section are performed on mated connector pairs.

3.7.7.1 Low Level Contact Resistance (EIA 364-23B)

The low level contact resistance (LLCR) measurement is made across the plug and receptacle mated contacts and does not include any internal paddle cards or substrates of the plug or receptacle. See Figure 3-59. The following apply to the power and signal contacts:

- 40 mΩ (Max) initial for VBUS, GND and all other contacts.
- 50 mΩ (Max) after environmental stresses.
- Measure at 20 mV (Max) open circuit at 100 mA.

Refer to Section 3.8 for environmental requirements and test sequences.

Figure 3-59 LLCR Measurement Diagram

3.7.7.2 Dielectric Strength (EIA 364-20)

No breakdown shall occur when 100 Volts AC (RMS) is applied between adjacent contacts of unmated and mated connectors.

3.7.7.3 Insulation Resistance (EIA 364-21)

A minimum of 100 MΩ insulation resistance is required between adjacent contacts of unmated and mated connectors.

3.7.7.4 Contact Current Rating

The current rating testing for the USB Type-C connector (plug and receptacle) shall be conducted per the following set up and procedures:

- A current of 5 A shall be applied collectively to VBUS pins (i.e., pins A4, A9, B4, and B9) and 1.25 A shall be applied to the VCONN pin (i.e., B5) as applicable, terminated through the corresponding GND pins (i.e., pins A1, A12, B1, and B12). A minimum current of 0.25 A shall also be applied individually to all the other contacts, as applicable. When current is applied to the contacts, the temperature of the connector pair shall be allowed to stabilize. The temperature rise of the outside

shell surface of the mated pair above the VBUS and GND contacts shall not exceed 30 °C above the ambient temperature. Figure 3-60 provides an illustration of the measurement location.

- The measurement shall be done in still air.
- The connectors shall be oriented such that the accessible outer shell surface is on top and horizontal to the ground.
- The plug and receptacle may require modification to access solder tails or cable attachment points.
- Either thermocouple or thermo-imaging (preferred) method may be used for temperature measurement
- For certification, the connector manufacturer shall provide the receptacle and plug samples under test mounted on a current rating test PCB with no copper planes. A cable plug may use short wires to attach the cable attachment points together rather than using a current rating test PCB.
 - The current rating test PCBs shall be of a 2-layer construction. If 2-layer construction is not possible due to the solder tail configuration, VBUS and ground traces shall be located on the outer layers with the inner layers reserved for signal traces, as required; VCONN traces may be routed either on internal or external layers. Table 3-34 defines the requirements for the test PCB thickness and traces. The trace length applies to each PCB (receptacle PCB and plug PCB) and is from the contact terminal to the current source tie point. Figure 3-61 provides an informative partial trace illustration of the current rating test PCB.
 - If short wires are used instead of a current rating test PCB, the wire length shall not exceed 70 mm, measured from the plug contact solder point to the other end of the wire. There shall be no paddle card or overmold included in the test set-up. Each plug solder tail shall be attached with a wire with the wire gauge of AWG 36 for signals, AWG 32 for power (VBUS and VCONN), and AWG 30 for ground.

Figure 3-60 Temperature Measurement Point

Table 3-34 Current Rating Test PCB

Item	Trace width (mm)	Trace length (mm) on each PCB	Thickness
Signal trace	0.25 max.	13 max.	35 µm (1 oz. copper)
Ground trace	1.57 max.	38 max.	35 µm (1 oz. copper)
VBUS and VCONN	1.25 max.	30 max.	35 µm (1 oz. copper)
PCB	N/A	N/A	0.80 – 1.20 mm

Figure 3-61 Example Current Rating Test Fixture Trace Configuration

3.8 Mechanical and Environmental Requirements (Normative)

The requirements in this section apply to all USB Type-C connectors and/or cable assemblies unless otherwise specified. For USB Type-C plug connectors and cable assemblies, the test methods are based on an assumption that the cable exits the overmold in line with mating direction to a USB Type-C receptacle (i.e., straight out the back of the overmold). For USB Type-C plug connectors and cable assemblies with the cable exiting the overmold in a different direction than straight out the back (e.g., right angle to the mating direction), test fixtures and procedures shall be modified as required to accomplish the measurement.

3.8.1 Mechanical Requirements

3.8.1.1 Insertion Force (EIA 364-13)

The initial connector insertion force shall be within the range from 5 N to 20 N at a maximum rate of 12.5 mm (0.492") per minute. This requirement does not apply when the connectors are used in a docking application.

It is recommended to use a non-silicone based lubricant on the latching mechanism to reduce wear. The effects of lubricants should be restricted to insertion and extraction characteristics and should not increase the resistance of the mated connection.

3.8.1.2 Extraction Force (EIA 364-13)

The initial connector extraction force shall be within the range of 8 N to 20 N, measured after a preconditioning of five insertion/extraction cycles (i.e., the sixth extraction). After an additional twenty-five insertion/extraction cycles, the extraction force shall be measured again (i.e., the thirty-second extraction) and the extraction force shall be:

- a. within 33% of the initial reading, and
- b. within the range of 8 N to 20 N.

The extraction force shall be within the range of 6 N to 20 N after 10,000 insertion/extraction cycles. The extraction force measurement shall be performed at a maximum speed of 12.5 mm (0.492") per minute. The extraction force requirement does not apply when the connectors are used in a mechanical docking application.

It is recommended to use a non-silicone based lubricant on the latching mechanism to reduce wear. The effects of lubricants should be restricted to insertion and extraction characteristics and should not increase the resistance of the mated connection.

3.8.1.3 Durability or Insertion/Extraction Cycles (EIA 364-09)

The durability rating shall be 10,000 cycles minimum for the USB Type-C connector family. The durability test shall be done at a rate of 500 ± 50 cycles per hour and no physical damage to any part of the connector and cable assembly shall occur.

3.8.1.4 Cable Flexing (EIA 364-41, Condition 1)

No physical damage or discontinuity over 1ms during flexing shall occur to the cable assembly with Dimension X = 3.7 times the cable diameter and 100 cycles in each of two planes.

3.8.1.5 Cable Pull-Out (EIA 364-38, Method A)

No physical damage to the cable assembly shall occur when it is subjected to a 40 N axial load for a minimum of 1 minute while clamping one end of the cable plug.

3.8.1.6 4-Axis Continuity Test

The USB Type-C connector family shall be tested for continuity under stress using a test fixture shown in Figure 3-62 or equivalent.

Figure 3-62 Example of 4-Axis Continuity Test Fixture

Figure 3-60 Example of 4-Axis Continuity Test Fixture, cont.

Plugs shall be supplied with a representative overmold or mounted on a 2 layer printed circuit board (PCB) between 0.8 mm and 1.0 mm thickness as applicable. A USB Type-C receptacle shall be mounted on a 2 layer PCB between 0.8 mm and 1.0 mm thickness. The PCB shall be clamped on three sides of the receptacle no further than 5 mm away from the receptacle outline. The receptacle PCB shall initially be placed in a horizontal plane, and a perpendicular moment shall be applied to the plug with a 5 mm ball tipped probe for a period of at least 10 seconds at a distance of 15 mm from the mating edge of the receptacle shell in a downward direction, perpendicular to the axis of insertion. See Table 3-35 for the force and moment to be applied.

Table 3-35 Force and Moment Requirements

Receptacle configuration with respect to mounting surface	Force at 15 mm from receptacle shell mating edge (N)	Moment with respect to receptacle shell mating edge (Nm)
Right angle	20	0.30
Vertical	8	0.12

The continuity across each contact shall be measured throughout the application of the tensile force. Each non-ground contact shall also be tested to confirm that it does not short to the shell during the stresses. The PCB shall then be rotated 90 degrees such that the cable is still inserted horizontally and the tensile force in Table 3-35 shall be applied again in the downward direction and continuity measured as before. This test is repeated for 180 degree and 270 degree rotations. Passing parts shall not exhibit any discontinuities or shorting to the shell greater than 1 μ s duration in any of the four orientations.

One method for measuring the continuity through the contacts is to short all the wires at the end of the cable pigtail and apply a voltage through a pull-up to each of VBUS, USB D+, USB D-, SBU, CC, and USB SuperSpeed pins, with the GND pins connected to ground.

Alternate methods are allowed to verify continuity through all pins.

3.8.1.7 Wrenching Strength

USB Type-C plugs on cable assemblies and fixture plugs without overmold (including PCB-mount USB Type-C plugs) shall be tested using the mechanical wrenching test fixture defined in the Universal Serial Bus Type-C Connectors and Cable Assemblies Compliance Document. For plug without overmold, the supplier shall provide a plug test fixture that conforms to the specified plug overmold dimensions for the USB Type-C plug (see Figure 3-63). The fixture may be metal or other suitable material. Perpendicular moments are applied to the plug with a 5 mm ball tipped probe for a period of at least 10 seconds when inserted in the test fixture to achieve the defined moments in four directions of up or down (i.e., perpendicular to the long axis of the plug opening) and left or right (i.e., in the plane of the plug opening). Compliant connectors shall meet the following force thresholds:

- A moment of 0-0.75 Nm (e.g., 50 N at 15 mm from the edge of the receptacle) is applied to a plug inserted in the test fixture in each of the four directions. A single plug shall be used for this test. Some mechanical deformation may occur. The plug shall be mated with the continuity test fixture after the test forces have been applied to verify no damage has occurred that causes discontinuity or shorting. The continuity test fixture shall provide a planar surface on the mating side located 6.20 ± 0.20 mm from the receptacle Datum A, perpendicular to the direction of insertion. No moment forces are applied to the plug during this continuity test. Figure 3-64 illustrates an example continuity test fixture to perform the continuity test. The Dielectric Withstanding Voltage test shall be conducted after the continuity test to verify plug compliance.

Figure 3-63 Example Wrenching Strength Test Fixture for Plugs without Overmold

Figure 3-64 Reference Wrenching Strength Continuity Test Fixture

- The plug shall disengage from the test fixture or demonstrate mechanical failure (i.e., the force applied during the test procedure peaks and drops off) when a moment of 2.0 Nm is applied to the plug in the up and down directions and a moment 3.5 Nm is applied to the plug in the left and right directions. A new plug is required for each of the four test directions. An example of the mechanical failure point and an illustration of the wrenching test fixture are shown in Figure 3-65 and Figure 3-66, respectively.

Figure 3-65 Example of Wrenching Strength Test Mechanical Failure Point

Figure 3-66 Wrenching Strength Test with Cable in Fixture

3.8.1.8 Restriction of Hazardous Substances

It is recommended that components be RoHS compliant.

3.8.2 Environmental Requirements

The connector interface environmental tests shall follow EIA 364-1000.01, Environmental Test Methodology for Assessing the Performance of Electrical Connectors and Sockets Used in Business Office Applications.

Since the connector defined has more than 0.127 mm wipe length, Test Group 6 in EIA 364-1000.01 is not required. The temperature life test duration and the mixed flowing gas test duration values are derived from EIA 364-1000.01 based on the field temperature per the following.

Table 3-36 Environmental Test Conditions

Temperature Life test temperature and duration	105 °C for 120 hours
Temperature Life test temperature and duration for preconditioning	105 °C for 72 hours
Mixed flowing gas test duration	7 days

The pass/fail criterion for the low level contact resistance (LLCR) is as defined in Section 3.7.7.1. The durability ratings are defined in Section 3.8.1.3.

3.8.2.1 Reference Materials (Informative)

This specification does not specify materials for connectors and cables. Connector and cable manufacturers should select appropriate materials based on performance requirements. The information below is provided for reference only.

Note: Connector and cable manufacturers should comply with contact plating requirements per the following options:

Option I

Receptacle

Contact area: (Min) 0.05 µm Au + (Min) 0.75 µm Ni-Pd on top of (Min) 2.0 µm Ni

Plug

Contact area: (Min) 0.05 µm Au + (Min) 0.75 µm Ni-Pd on top of (Min) 2.0 µm Ni

Option II

Receptacle

Contact area: (Min) 0.75 µm Au on top of (Min) 2.0 µm Ni

Plug

Contact area: (Min) 0.75 µm Au on top of (Min) 2.0 µm Ni

Other reference materials that connector and cable manufacturers select based on performance parameters listed in Table 3-37 are for reference only.

Table 3-37 Reference Materials

Component	Materials
Cable	Conductor: copper with tin or silver plating
	SDP Shield: AL foil or AL/mylar foil
	Coaxial shield: copper strand
	Braid: Tin plated copper or aluminum
	Jacket: PVC or halogen free substitute material
Cable Overmold	Thermoset or thermoplastic
Connector Shells	Stainless steel or phosphor bronze
Plug Side Latches	Stainless steel
Receptacle Mid-Plate	Stainless steel
Plug Internal EMC Spring	Stainless steel or high yield strength copper alloy
Receptacle EMC Pad	Stainless steel or phosphor bronze
Receptacle Shell	Stainless steel or phosphor bronze
Receptacle Tongue	Glass-filled nylon
Housing	Thermoplastics capable of withstanding lead-free soldering temperature

Note: Halogen-free materials should be considered for all plastics

3.9 Docking Applications (Informative)

In this specification, docking refers to plugging a device directly into a dock without using a cable assembly. The USB Type-C connector is defined to support such applications.

The connector is only part of a docking solution. A complete docking solution at the system level may also include retention or locking mechanisms, alignment mechanisms, docking plug mounting solutions, and protocols supported through the connector. This specification does not attempt to standardize system docking solutions, therefore there is no interoperability requirement for docking solutions.

The following list includes the requirements and guidelines when using the USB Type-C connector for docking:

1. The USB Type-C plug used for docking shall work with compliant USB Type-C receptacle. It shall comply with all dimensional, electrical and mechanical requirements.
2. If the plug on the dock does not include the side latches, then the dock should provide a retention or locking mechanism to secure the device to the plug. The retention latches also serve as one of the ground return paths for EMC. The docking

design should ensure adequate EMC performance without the side latches if they are not present.

3. The internal EMC fingers are not required for the docking plug as long as the receptacle and plug shells have adequate electrical connection.
4. Alignment is critical for docking. Depending on system design, standard USB Type-C connectors alone may not provide adequate alignment for mating. System level alignment is highly recommended. Alignment solutions are implementation-specific.
5. Fine alignment is provided by the connector. The receptacle front face may have lead-in features for fine alignment. Figure 3-67 shows an example of a USB Type-C receptacle with a lead-in flange compared to a receptacle without the flange.

Figure 3-67 USB Type-C Cable Receptacle Flange Example

3.10 Implementation Notes and Design Guides

This section discusses a few implementation notes and design guides to help users design and use the USB Type-C connectors and cables.

3.10.1 EMC Management (Informative)

Connector and cable assembly designers, as well as system implementers should pay attention to receptacle and cable assembly shielding to ensure a low-impedance grounding path. The following are guidelines for EMC management:

- The quality of raw cables should be ensured. The intra-pair skew or the differential to common mode conversion of the SuperSpeed pairs has a significant impact on cable EMC and should be controlled within the limits of this specification.
- The cable external braid should be physically connected to the plug metal shell as close to 360° as possible to control EMC. Without appropriate shielding termination, even a perfect cable with zero intra-pair skew may not meet EMC requirements. Copper tape may be needed to shield off the braid termination area.
- The wire termination contributes to common-mode noise. The breakout distance for the wire termination should be kept as small as possible to optimize EMC and signal

integrity performance. If possible, symmetry should be maintained for the two lines within a differential pair.

- Besides the mechanical function, the side latches on the plug and the mid-plate in the receptacle also play a role for EMC. This is illustrated in Figure 3-68:
 1. The side latch should have electrical connection to the receptacle mid-plate (a docking plug may not have side latches).
 2. The side latches should be terminated to the paddle card GND plane inside the plug.
 3. The mid-plate should be directly connected to system PCB GND plane with 3 or more solder leads/tails.

Figure 3-68 EMC Guidelines for Side Latch and Mid-plate

- The internal RFI finger inside the plug should have adequate connection points to the inner surface of the plug shell. Four or more connection points are recommended as illustrated in Figure 3-69.

Figure 3-69 EMC Finger Connections to Plug Shell

- The EMC fingers inside the plug mates with the EMC pad in the receptacle. It is important for the EMC pad to have adequate connections to the receptacle shell. As illustrated in Figure 3-70, there are multiple laser welding points between the EMC pads and the receptacle shell, top and bottom.
- The receptacle shell should have sufficient connection points to the system PCB GND plane with apertures as small as possible. Figure 3-70 illustrates an example with multiple solder tails to connect the receptacle shell to system PCB GND.

Figure 3-70 EMC Pad Connections to Receptacle Shell

- Apertures in the receptacle and plug shells should be minimized. If apertures are unavoidable, a maximum aperture size of 1.5 mm is recommended. See Figure 3-71 for aperture illustrations. Copper tape may be applied to seal the apertures inside the cable plug.

Figure 3-71 Examples of Connector Apertures

- The receptacle connectors should be connected to metal chassis or enclosures through grounding fingers, screws, or any other way to manage EMC.

3.10.2 Stacked and Side-by-Side Connector Physical Spacing (Informative)

Stacked and side-by-side USB connectors are commonly used in PC systems. Figure 3-72 illustrates the recommended spacing between connectors for stacked and side-by-side configurations.

Figure 3-72 Recommended Minimum Spacing between Connectors

3.10.3 Cable Mating Considerations (Informative)

The receptacle mounting location, exterior product surfaces, cable overmold, and plug mating length need to be considered to ensure the USB Type-C plug is allowed to fully engage the USB Type-C receptacle. Figure 3-73 illustrates the recommended minimum plug overmold clearance to allow the cable plug to fully seat in the product receptacle.

Figure 3-73 Recommended Minimum Plug Overmold Clearance

Figure 3-74 illustrates special considerations required when external walls are angled. For such applications, the USB Type-C receptacle shell may not provide as much mechanical alignment protection to the receptacle tongue as in the full shell design. Design options to allow the receptacle to pass mechanical test requirements include relief in the exterior wall surface to allow use of a full shell receptacle or use of a receptacle specifically designed for the application.

Figure 3-74 Cable Plug Overmold and an Angled Surface

4 Functional

This chapter covers the functional requirements for the signaling across the USB Type-C™ cables and connectors. This includes functional signal definition, discovery and configuration processes, and power delivery.

Chapter 5 defines functional extensions that are optional.

4.1 Signal Summary

Table 4-1 summarizes the list of signals used on the USB Type-C connectors.

Table 4-1 USB Type-C List of Signals

Signal Group	Signal	Description
USB 3.1	SSTXp1, SSTXn1 SSRXp1, SSRXn1 SSTXp2, SSTXn2 SSRXp2, SSRXn2	SuperSpeed USB serial data interface defines 1 differential transmit pair and 1 differential receive pair. On a USB Type-C receptacle, two sets of SuperSpeed USB signal pins are defined to enable plug flipping feature
USB 2.0	Dp1, Dn1 Dp2, Dn2	USB 2.0 serial data interface defines a differential pair. On a USB Type-C receptacle, two set of USB 2.0 signal pins are defined to enable plug flipping feature
Configuration	CC1, CC2 (receptacle) CC (plug)	CC channel in the plug used for connection detect, interface configuration and VCONN
Auxiliary signals	SBU1, SBU2	Sideband Use
Power	VBUS	USB cable bus power
	VCONN (plug)	USB plug power
	GND	USB cable return current path

4.2 Signal Pin Descriptions

4.2.1 SuperSpeed USB Pins

**SSTXp1, SSTXn1
(SSTXp2, SSTXn2)** These pins are required to implement the system's transmit path of a [USB 3.1](#) SuperSpeed interface. The transmitter differential pair in a port are routed to the receiver differential pair in the port at the opposite end of the path. The [USB 3.1 Specification](#) defines all electrical characteristics, enumeration, protocol, and management features for this interface.

Two pairs of pins are defined to enable the plug flipping feature – see Section 4.5.1.1 for further definition.

**SSRXp1, SSRXn1
(SSRXp2, SSRXn2)** These pins are required to implement the system's receive path of a [USB 3.1](#) SuperSpeed interface. The receiver differential pair in a port are routed to the transmitter differential pair in the port at the opposite end of the path. The [USB 3.1 Specification](#) defines all electrical characteristics, enumeration, protocol, and management features for this interface.

Two pairs of pins are defined to enable the plug flipping feature – see Section 4.5.1.1 for further definition.

4.2.2 USB 2.0 Pins

**D_{p1}, D_{n1}
(D_{p2}, D_{n2})** These pins are required to implement [USB 2.0](#) functionality. [USB 2.0](#) in all three modes (LS, FS, and HS) is supported. The [USB 2.0 Specification](#) defines all electrical characteristics, enumeration, and bus protocol and bus management features for this interface.

Two pairs of pins are defined to enable the plug flipping feature – see Section 4.5.1.1 for further definition.

4.2.3 Auxiliary Signal Pins

SBU1, SBU2 These pins are assigned to sideband use. Refer to Section 4.3 for the functional requirements.

4.2.4 Power and Ground Pins

V_{BUS} These pins are for USB cable bus power as defined by the USB specifications. V_{BUS} is only present when a Source-to-Sink connection across the CC channel is present – see Section 4.5.1.2.1. Refer to Section 4.4.2 for the functional requirements for V_{BUS}.

V_{CONN} V_{CONN} is applied to the unused CC pin to supply power to the local plug. Refer to Section 4.4.3 for the functional requirements for V_{CONN}.

GND Return current path.

4.2.5 Configuration Pins

CC1, CC2, CC These pins are used to detect connections and configure the interface across the USB Type-C cables and connectors. Refer to Section 0 for the functional definition. Once a connection is established, CC1 or CC2 will be reassigned for providing power over the V_{CONN} pin of the plug – see Section 4.5.1.2.1.

4.3 Sideband Use (SBU)

The Sideband Use pins (SBU1 and SBU2) are limited to the uses as defined by this specification and additional functionality will be defined in future versions of the USB specifications. See Section 5.1 and Appendix A for use of the SBU pins in Alternate Modes and Audio Adapter Accessory Mode.

The SBU pins on a port shall either be open circuit or have a weak pull-down to ground no stronger than [zSBUTermination](#).

These pins are pre-wired in the standard USB Full-Featured Type-C cable as individual single-ended wires (SBU_A and SBU_B). Note that SBU1 and SBU2 are cross-connected in the cable.

4.4 Power and Ground

4.4.1 IR Drop

The maximum allowable cable IR drop for ground (including ground on a captive cable) shall be 250 mV and for V_{BUS} shall be 500 mV through the cable to the cable's maximum rated V_{BUS} current capacity. When V_{CONN} is being sourced, the IR drop for the ground shall still be met considering any additional V_{CONN} return current.

Figure 4-1 illustrates what parameters contribute to the IR drop and where it shall be measured. The IR drop includes the contact resistance of the mated plug and receptacles at each end.

Figure 4-1 Cable IR Drop

Figure 4-2 illustrates what parameters contribute to the IR drop for a powered cable and where it shall be measured. Note that the powered cable includes isolation elements (Iso) and loads (L1 and L2) for the functions in the powered cable such as [USB PD](#) controllers. The IR drop shall remain below 250 mV in all cases.

Figure 4-2 Cable IR Drop for powered cables

4.4.2 V_{BUS}

The allowable default range for V_{BUS} as measured at the Source receptacle shall be as defined by the [USB 2.0 Specification](#) and [USB 3.1 Specification](#). Note that due to higher currents allowed, legacy devices may experience a higher voltage (up to 5.5V maximum) at light loads.

The Source's USB Type-C receptacle V_{BUS} pin shall remain unpowered and shall limit the capacitance between V_{BUS} and GND as specified in Table 4-2 until a Sink is attached. The V_{BUS} pin shall return to the unpowered state when the Sink is detached. See Table 4-25 for V_{BUS} timing values. Legacy hosts/chargers that by default source V_{BUS} when connected

using any legacy USB connector (Standard-A, Micro-B, etc.) to USB Type-C cable or adapter are exempted from these two requirements.

A DRP or Source (or device with Accessory Support) implementing an [Rp](#) pull-up as its method of connection detection shall provide an impedance between VBUS and GND on its receptacle pins as specified in Table 4-2 when not sourcing power on VBUS (i.e., when in states [Unattached.SRC](#) or [Unattached.Accessory](#)).

Table 4-2 VBUS Source Characteristics

	Minimum	Maximum	Notes
VBUS Leakage Impedance	72.4 kΩ		Leakage between VBUS pins and GND pins on receptacle when VBUS is not being sourced.
VBUS Capacitance		10 μF	Capacitance between VBUS and GND pins on receptacle when VBUS is not being sourced.

[Table 4-3 specifies VBUS Sink characteristics with regard to disconnect behavior based on monitoring VBUS. Sinks may monitor the CC pin for the removal of Rp by the Source as an additional indication of disconnect.](#)

Table 4-3 VBUS Sink Characteristics

	<u>Minimum</u>	<u>Maximum</u>	<u>Notes</u>
<u>tSinkDisconnect</u>		<u>40 ms</u>	<u>Time limit for transition from Attached.SNK to Unattached.SNK</u>
<u>vSinkDisconnect</u>	<u>0.8V</u>	<u>3.67V</u>	<u>Threshold used for transition from Attached.SNK to Unattached.SNK. This also applies for USB PD contracts at 5V. For USB PD contracts at 5V, the Sink shall take IR drop and margin into account when selecting this threshold.</u>
<u>vSinkPD_min</u>		<u>vNew – 750 mV + vValid</u>	<u>Minimum valid VBUS voltage seen by sink when negotiated through USB PD.</u> <u>vNew = vSrcNew (min) or vPpsNew (min) as defined in USB PD.</u> <u>750mV= 500mV + 250mV (maximum IR drop)</u> <u>vValid = vSrcValid (min) or vPpsValid (min) as defined in USB PD.</u>
<u>vSinkDisconnectPD</u>	<u>90% of vSinkPD_min</u>	<u>vSinkPD_min</u>	<u>VBUS disconnect threshold when VBUS voltage was negotiated through USB PD to a value above 5V</u>

4.4.3 VCONN

VCONN is provided by the Source to power cables with electronics in the plug. VCONN is provided over the CC pin that is determined not to be connected to the CC wire of the cable.

Initially, VCONN shall be sourced ~~by~~on all Source USB Type-C receptacles that ~~source~~ VBUS ~~and~~ utilize the SSTX and SSRX pins during specific connection states as described in Section 4.5.2.2. Subsequently, VCONN may be removed under some circumstances as described in Table 4-4. VCONN may also be sourced by USB Type-C receptacles that do not utilize the SSTX and SSRX pins as described in Section 4.5.2.2. USB PD VCONN_Swap command also provides the Source a means to request that the attached Sink ~~supply~~source VCONN.

Table 4-4 USB Type-C Source Port's VCONN Requirements Summary

D+/D-	SSTX/SSRX, <u>VPD</u>	> 3 A	VCONN Requirements
No	No	No	Not required to source VCONN
Yes	No	No	Not required to source VCONN
Yes	Yes	No	Required to source 1 W. VCONN power may be removed after the source has read the cable's eMarker and has determined that it is not an active cable <u>nor a VPD</u> .
No	No	Yes	Required to source <u>4-W100 mW</u> . VCONN power may be removed after the source has read the cable's eMarker and has determined the cable's current carrying capacity.
Yes	No	Yes	Required to source <u>4-W100 mW</u> . VCONN power may be removed after the source has read the cable's eMarker and has determined the cable's current carrying capacity.
Yes	Yes	Yes	Required to source 1 W. VCONN power may be removed after the source has read the cable's eMarker and has determined the cable's current carrying capacity and that it is not an active cable <u>nor a VPD</u> .

Table 4-5 provides the voltage and power requirements that shall be met for VCONN. See Section 4.9 for more details about Electronically Marked Cables~~Electronically Marked Cables. See Section for a wider VCONN voltage operating range for VCONN-powered accessories.~~ See Section 5.1 regarding optional support for an increased VCONN power range in Alternate Mode~~Alternate Modes~~.

Table 4-5 VCONN Source Characteristics

	Minimum	Maximum	Notes
Voltage	4.753.0 V	5.5 V	Ports that support VCONN-powered accessories are allowed to supply at a lower minimum of 2.7 V when operating in the PoweredAccessory state.
Power for Sources with SuperSpeed Signals or VPD support	1.0 W		Source may latch-off VCONN if excessive power is drawn beyond the specified inrush and <u>mode</u> wattage. <u>Source may disable VCONN per Table 4-3.</u> <u>Alternate modes may require higher power.</u>
Bulk Capacitance Power for Sources in USB Suspend or without SuperSpeed Signals	10 μF100 mW	220 μF	The VCONN source shall disconnect the bulk capacitance from the receptacle when VCONN is powered off. <u>Minimum power Source must provide in USB Suspend or without SuperSpeed signals.</u> <u>Source may disable VCONN per Table 4-3.</u>
Rdch	30 Ω	6120 Ω	<u>Discharge resistance applied in UnattachedWait.SRC between the CC pin being discharged and GND.</u>

To aid in reducing the power associated with supplying VCONN, a Source is allowed to either not source VCONN or turn off VCONN under any of the following conditions:

- R_a is not detected on the CC pin after tCCDebounce when the other CC pin is in the SRC.Rd state
- is not detected on the CC pin after when the other CC pin is in the state and the port supports VCONN powered accessories
- If there is no GoodCRC response to USB PD Discover Identity messages

If the power source used to supply VCONN power is a shared power source for other USB VCONN and VBUS outputs, it must be bypassed with capacitance identical to the VBUS capacitance requirements of USB 3.1 Section 11.4.4 – Dynamic Attach and Detach. Any VCONN power source bypass capacitance must be isolated from the CC pins when VCONN is not being provided.

Table 4-6 provides the requirements that shall be met for cables that consume VCONN power.

Table 4-6 Cable VCONN Sink Characteristics

	Minimum	Maximum	Notes
Voltage	<u>3.0</u>	<u>5.5V</u>	<u>Voltage range at which this Table applies</u>
Inrush Capacitance		10 μ F	A cable shall not present more than the equivalent inrush capacitance to the VCONN source. The active cable is responsible for discharging its capacitance.
Power for Electronically Marked <u>Passive</u> Cables		<u>70 mW</u> <u>20mW</u>	See Section 4.9. <u>Measured with no USB PD traffic at least 500ms after VCONN applied</u> <u>Note: 75mW max allowed for the first 500ms after VCONN applied.</u>
Power for Active Cables <u>when connected to a Source with SuperSpeed Signals</u>		1.0 W	See Section 5.2.
Power for Active Cables <u>when connected to a Source without SuperSpeed Signals or in USB Suspend</u>		<u>70mW</u>	<u>Maximum power for active cables in USB suspend or when connected to a Source without SuperSpeed signals.</u> <u>Measured with no USB PD traffic at least 500ms after VCONN applied</u> <u>Note: 100 mW max allowed for the first 500 ms after VCONN applied.</u>
tVCONNDischarge		<u>250 ms</u> <u>230ms</u>	<u>The Time from the point that the cable is detached until disconnect to vVCONNDischarge shall be met.</u>
vVCONNDischarge		<u>150 mV</u> <u>800mV</u>	<u>The VCONN voltage following cable detach and self discharge after tVCONNDischarge</u>
vRaReconnect	<u>800mV</u>		<u>Voltage at which the cable shall reapply Ra on the falling edge of VCONN.</u>

The cable may remove or weaken Ra when VCONN is in the valid voltage range. The cable shall reapply Raabove 1.0 V when VCONN falls below vRaReconnect as defined in Table 4-6. The cable shall discharge VCONN to below vVCONNDischarge on a cable disconnect. The cable shall take into account the VCONN capacitance present in the cable when discharging VCONN.

Implementation Note: Increasing Ra to 20KΩ will meet both the power dissipation for electronically marked passive cables and discharge 10μF to less than vVCONNDischarge in tVCONNDischarge.

Table 4-7 VCONN-Powered Accessory (VPA) Sink Characteristics

	<u>Minimum</u>	<u>Maximum</u>	<u>Notes</u>
<u>Voltage</u>	<u>3.0 V</u>	<u>5.5 V</u>	<u>Voltage range at which this Table applies</u>
<u>Inrush Capacitance</u>		<u>10 μF</u>	<u>An accessory shall not present more than the equivalent inrush capacitance to the VCONN source. The accessory is responsible for discharging its capacitance when detached from a port.</u>
<u>Power before Alternate Mode Entry</u>		<u>35 mW</u>	<u>Maximum power in USB suspend Note: Power shall be reduced 5 seconds after VCONN is applied if no Alternate Mode Entry has occurred. A VCONN power cycle may be required to re-enable USB-PD communication.</u>
<u>tVCONNDischarge</u>		<u>230 ms</u>	<u>Time from cable disconnect to vVCONNDischarge met.</u>
<u>vVCONNDischarge</u>		<u>800 mV</u>	<u>VCONN voltage after tVCONNDischarge</u>
<u>vRaReconnect</u>	<u>800 mV</u>		<u>Voltage at which the cable shall reapply Ra on the falling edge of VCONN.</u>
<u>vVCONNDisconnect</u>	<u>800 mV</u>	<u>2.4 V</u>	<u>Threshold used to detect VCONN disconnect.</u>

The VCONN powered accessory shall remove or weaken Ra when VCONN is in the valid voltage range. The VCONN powered accessory shall reapply Ra along when VCONN falls below vRaReconnect as defined in Table 4-7 the other requirements are met. See Section . The VCONN powered accessory shall take into account the VCONN capacitance present in the accessory when discharging VCONN.

The maximum power consumption while in an Alternate Mode is defined by the Alternate Mode.

Table 4-8 VCONN-Powered USB Device (VPD) Sink Characteristics

	<u>Minimum</u>	<u>Maximum</u>	<u>Notes</u>
<u>Voltage</u>	<u>3.0 V</u>	<u>5.5 V</u>	<u>Voltage range at which this Table applies</u>
<u>Inrush Capacitance</u>		<u>10 µF</u>	<u>A VPD shall not present more than the equivalent inrush capacitance to the VCONN source. The VPD is responsible for discharging its capacitance when detached from a port.</u>
<u>Power before USB enumeration</u>		<u>35 mW</u>	<u>Maximum power in USB suspend</u>
<u>Power when active</u>		<u>500 mW (USB 2.0) 750 mW (USB 3.1)</u>	<u>A VPD shall only expose a low-power interface over USB.</u>
<u>tVCONNDischarge</u>		<u>230 ms</u>	<u>Time from VPD disconnect to vVCONNDischarge met.</u>
<u>vVCONNDischarge</u>		<u>800 mV</u>	<u>VCONN voltage after tVCONNDischarge</u>
<u>vRaReconnect</u>	<u>800 mV</u>		<u>Voltage at which the cable shall reapply Ra on the falling edge of VCONN.</u>
<u>vVCONNDisconnect</u>	<u>800 mV</u>	<u>2.4 V</u>	<u>Threshold used to detect VCONN disconnect.</u>

The VPD shall remove or weaken Ra when VCONN is in the valid voltage range.

The VPD shall reapply Ra when VCONN falls below vRaReconnect as defined in Table 4-8. The VPD shall take into account the VCONN capacitance present in the device when discharging VCONN.

4.5 Configuration Channel (CC)

4.5.1 Architectural Overview

For the USB Type-C solution, two pins on the connector, CC1 and CC2, are used to establish and manage the Source-to-Sink connection. ~~Note that in this section, "direct connect" is used to refer to a device connected directly to a host (e.g., a thumb drive).~~ When the device is connected through a hub, the connection between a Sink (UFP) on the hub and the Source (host port) and the connection between the Sink (device port) and a Source (DFP on the hub), are treated as separate connections. Functionally, the configuration channel is used to serve the following purposes.

- Detect attach of USB ports, e.g. a Source to a Sink
- Resolve cable orientation and twist connections to establish USB data bus routing
- Establish data roles between two attached ports
- Discover and configure VBUS: USB Type-C Current modes or [USB Power Delivery](#)

- Configure VCONN
- Discover and configure optional Alternate and Accessory modes

4.5.1.1 USB Data Bus Interface and USB Type-C Plug Flip-ability

Since the USB Type-C plug can be inserted in either right-side-up or upside-down position, the hosts and devices that support USB data bus functionality must operate on the signal pins that are actually connected end-to-end. In the case of USB 2.0, this is done by shorting together the two D+ signal pins and the two D- signal pins in the host and device receptacles. In the case of USB SuperSpeed signals, it requires the functional equivalent of a switch in both the host and device to appropriately route the SuperSpeed TX and RX signal pairs to the connected path through the cable.

Figure 4-3 illustrates the logical data bus model for a USB Type-C-based Host connected to a USB Type-C-based Device. The USB cable that sits between a host and device can be in one of four possible connected states when viewed by the host:

- Un-flipped straight through – Position ① \Leftrightarrow Position ①
- Un-flipped twisted through – Position ① \Leftrightarrow Position ②
- Flipped straight through – Position ② \Leftrightarrow Position ②
- Flipped twisted through – Position ② \Leftrightarrow Position ①

To establish the proper routing of the active USB data bus from host to device, the standard USB Type-C cable is wired such that a single CC wire is position aligned with the first USB SuperSpeed signal pairs (SSTXp1/SSTXn1 and SSRXp1/SSRXn1) – in this way, the CC wire and USB SuperSpeed data bus wires that are used for signaling within the cable track with regard to the orientation and twist of the cable. By being able to detect which of the CC pins (CC1 or CC2) at the receptacle is terminated by the device, the host is able to determine which SuperSpeed USB signals are to be used for the connection and the host can use this to control the functional switch for routing the SuperSpeed USB signal pairs. Similarly in the device, detecting which of the CC pins at the receptacle is terminated by the host allows the device to control the functional switch that routes its SuperSpeed USB signal pairs.

Figure 4-3 Logical Model for Data Bus Routing across USB Type-C-based Ports

While Figure 4-3 illustrates the functional model as a host connected to a device, this model equally applies to a USB hub's downstream ports as well.

Figure 4-4 illustrates the logical data bus model for a USB Type-C-based Device (implemented with a USB Type-C plug either physically incorporated into the device or permanently attached as a captive cable) connected directly to a USB Type-C-based Host. For the device, the location of the USB SuperSpeed data bus, [USB 2.0](#) data bus, CC and VCONN pins are fixed by design. Given that the device pin locations are fixed, only two possible connected states exist when viewed by the host.

Figure 4-4 Logical Model for USB Type-C-based Ports for the Direct Connect Device

The functional requirements for implementing SuperSpeed USB data bus routing for the USB Type-C receptacle are not included in the scope of this specification. There are multiple host, device and hub architectures that can be used to accomplish this which could include either discrete or integrated switching, and could include merging this functionality with other USB 3.1 design elements, e.g. a bus repeater.

4.5.1.2 Connecting Sources and Sinks

Given that the USB Type-C receptacle and plug no longer differentiate host and device roles based on connector shape, e.g., as was the case with USB Type-A and Type-B connectors, any two ports that have USB Type-C receptacles can be connected together with a standard USB Type-C cable. Table 4-9 summarizes the expected results when interconnecting Source, Sink and DRP ports.

Table 4-9 USB Type-C-based Port Interoperability

	Source-only	Sink-only	DRP (Dual-Role-Power)
Source-only	Non-functional	Functional	Functional
Sink-only	Functional	Non-functional	Functional
DRP (Dual-Role-Power)	Functional	Functional	Functional*

* Resolution of roles may be automatic or manually driven

In the cases where no function results, neither port shall be harmed by this connection. The user has to independently realize the invalid combination and take appropriate action to resolve. While these two invalid combinations mimic traditional USB where host-to-host and device-to-device connections are not intended to work, the non-keyed USB Type-C solution does not prevent the user from attempting such interconnects. VBUS and VCONN shall not be applied by a Source (host) in these cases.

The typical flow for the configuration of the interface in the general USB case of a Source (Host) to a Sink (Device) is as follows:

1. Detect a valid connection between the ports (including determining cable orientation, Source/Sink and DFP/UFP relationship)
2. Optionally discover the cable's capabilities
3. Optionally establish alternatives to traditional USB power (See Section 4.6.2)
 - a. [USB PD](#) communication over CC for advanced power delivery negotiation
 - b. USB Type-C Current modes
 - c. USB BC 1.2
4. USB Device Enumeration

For cases of Dual-Role-Power (DRP) ports connecting to either Source-only, Sink-only or another DRP, the process is essentially the same except that during the detecting a valid connection step, the DRP alternates between operating as a Source for detecting an attached Sink and presenting as a Sink to be detected by an attached Source. Ultimately this results in a Source-to-Sink connection.

4.5.1.2.1 Detecting a Valid Source-to-Sink Connection

The general concept for setting up a valid connection between a Source and Sink is based on being able to detect terminations residing in the product being attached.

To aid in defining the functional behavior of CC, a pull-up ([Rp](#)) and pull-down ([Rd](#)) termination model is used – actual implementation in hosts and devices may vary, for example, the pull-up termination could be replaced by a current source. Figure 4-5 and Figure 4-6 illustrates two models, the first based on a pull-up resistor in the Source and the second replacing this with a current source.

Figure 4-5 Pull-Up/Pull-Down CC Model

Figure 4-6 Current Source/Pull-Down CC Model

Initially, a Source exposes independent Rp terminations on its CC1 and CC2 pins, and a Sink exposes independent Rd terminations on its CC1 and CC2 pins, the Source-to-Sink combination of this circuit configuration represents a valid connection. To detect this, the Source monitors CC1 and CC2 for a voltage lower than its unterminated voltage – the choice of Rp is a function of the pull-up termination voltage and the Source's detection circuit. This indicates that either a Sink, a powered cable, or a Sink connected via a powered cable has been attached.

Prior to application of VCONN, a powered cable exposes Ra on its VCONN pin. Ra represents the load on VCONN plus any resistive elements to ground. In some cable plugs it might be a pure resistance and in others it may be simply the load.

The Source has to be able to differentiate between the presence of Rd and Ra to know whether there is a Sink attached and where to apply VCONN. The Source is not required to source VCONN unless Ra is detected.

Two special termination combinations on the CC pins as seen by a Source are defined for directly attached Accessory Modes: Ra/Ra for Audio Adapter Accessory Mode (Appendix A) and Rd/Rd for Debug Accessory Mode (Appendix B).

The Source uses de-bounce timers to reliably detect states on the CC pins to de-bounce the connection ([tCCDebounce](#)), and hide USB PD BMC communications ([tPDDebounce](#)).

Table 4-10 summarizes the port state from the Source's perspective.

Table 4-10 Source Perspective

CC1	CC2	State	Position
Open	Open	Nothing attached	N/A
Rd	Open	Sink attached	①
Open	Rd		②
Open	Ra	Powered cable without Sink attached	①
Ra	Open		②
Rd	Ra	Powered cable with Sink, VCONN-Powered Accessory (VPA) , or VCONN-Powered USB Device VCONN-powered Accessory (VPD) attached	①
Ra	Rd	Debug Accessory Mode attached (Appendix B)	②
Rd	Rd		N/A
Ra	Ra	Audio Adapter Accessory Mode attached (Appendix A)	N/A

Once the Sink is powered, the Sink monitors CC1 and CC2 for a voltage greater than its local ground. The CC pin that is at a higher voltage (i.e. pulled up by [Rp](#) in the Source) indicates the orientation of the plug.

Table 4-11 summarizes the typical behaviors for simple Sources (Hosts) and Sinks (Devices) for each state in Table 4-10.

Table 4-11 Source (Host) and Sink (Device) Behaviors by State

State	Source Behavior	Sink Behavior
Nothing attached	<ul style="list-style-type: none"> • Sense CC pins for attach • Do not apply VBUS or VCONN 	<ul style="list-style-type: none"> • Sense VBUS for attach
Sink attached	<ul style="list-style-type: none"> • Sense CC for orientation • Sense CC for detach • Apply VBUS and VCONN 	<ul style="list-style-type: none"> • Sense CC pins for orientation • Sense loss of VBUS for detach
Powered cable without Sink attached	<ul style="list-style-type: none"> • Sense CC pins for attach • Do not apply VBUS or VCONN 	<ul style="list-style-type: none"> • Sense VBUS for attach
Powered cable with Sink, <u>VCONN-Powered Accessory</u>, or <u>VCONN-Powered Accessory</u><u>USB Device</u> attached	<ul style="list-style-type: none"> • Sense CC for orientation • Sense CC for detach • <u>Apply VBUS and VCONN</u> • <u>Detect VPD and remove VBUS</u> 	<ul style="list-style-type: none"> • If accessories <u>or VPDs</u> are supported, see Source Behavior with exception that VBUS is not applied., otherwise, N/A.
Debug Accessory Mode attached	<ul style="list-style-type: none"> • Sense CC pins for detach • Reconfigure for debug 	<ul style="list-style-type: none"> • Sense VBUS for detach • Reconfigure for debug
Audio Adapter Accessory Mode attached	<ul style="list-style-type: none"> • Sense CC pins for detach • Reconfigure for analog audio 	<ul style="list-style-type: none"> • If accessories are supported, see Source Behavior, otherwise, N/A

Figure 4-3 shows how the inserted plug orientation is detected at the Source's receptacle by noting on which of the two CC pins in the receptacle an Rd termination is sensed. Now that the Source (Host) has recognized that a Sink (Device) is attached and the plug orientation is determined, it configures the SuperSpeed USB data bus routing to the receptacle.

The Source (Host) then turns on VBUS. For the CC pin that does not connect Source-to-Sink through the cable, the Source supplies VCONN and may remove the termination. With the Sink (Device) now powered, it configures the USB data path. This completes the Host-to-Device connection.

The Source monitors the CC wire for the loss of pull-down termination to detect detach. If the Sink is removed, the Source port removes any voltage applied to VBUS and VCONN, resets its interface configuration and resumes looking for a new Sink attach.

Once a valid Source-to-Sink connection is established, alternatives to traditional USB power (VBUS as defined by either USB 2.0 or USB 3.1 specifications) may be available depending on the capabilities of the host and device. These include USB Type-C Current, USB Power Delivery, and USB Battery Charging 1.2.

In the case where USB PD PR_Swap is used to swap the Source and Sink of VBUS, the supplier of VCONN remains unchanged during and after the VBUS power swap. The new Source monitors the CC wire and the new Sink monitors VBUS to detect detach. When a detach event is detected, any voltages applied to VBUS and VCONN are removed, each port resets its interface configuration and resumes looking for an attach event.

In the case where USB PD DR_Swap is used to swap the data roles (DFP and UFP), the source of VBUS and VCONN do not change after the data role swap.

In the case where [USB PD VCONN_Swap](#) is used to swap the VCONN source, the VBUS Source/Sink and DFP/UFP roles are maintained during and after the VCONN swap.

The last step in the normal USB Type-C connect process is for the USB device to be attached and enumerated per standard [USB 2.0](#) and [USB 3.1](#) processes.

4.5.1.3 Configuration Channel Functional Models

The functional models for the configuration channel behavior based on the CC1 and CC2 pins are described in this section for each port type: Source, Sink and Dual-Role-Power (DRP).

The figures in the following sections illustrate the CC1 and CC2 routing after the CC detection process is complete. In these figures, VBUS and VCONN may or may not actually be available.

4.5.1.3.1 Source Configuration Channel Functional Model

Figure 4-7 illustrates the functional model for CC1 and CC2 for a Source port prior to attach. This illustration includes consideration for [USB PD](#).

Figure 4-7 Source Functional Model for CC1 and CC2

Referring to Figure 4-7, a port that behaves as a Source has the following functional characteristics:

1. The Source uses a FET to enable/disable power delivery across VBUS and initially the Source has VBUS disabled.
2. The Source supplies pull-up resistors ([Rp](#)) on CC1 and CC2 and monitors both to detect a Sink. The presence of an [Rd](#) pull-down resistor on either pin indicates that a Sink is being attached. The value of [Rp](#) indicates the initial USB Type-C Current level supported by the host.
3. The Source uses the CC pin pull-down characteristic to detect and establish the correct routing for the USB SuperSpeed data path and determine which CC pin is intended for supplying VCONN.
4. Once a Sink is detected, the Source enables VBUS and VCONN.
5. The Source can dynamically adjust the value of [Rp](#) to indicate a change in available USB Type-C Current to a Sink.

6. The Source monitors the continued presence of [Rd](#) to detect Sink detach. When a detach event is detected, the Source removes, if supplied, VBUS and VCONN, and returns to step 2.
7. If the Source supports advanced functions (USB Power Delivery and/or Alternate Modes), [USB PD](#) communication is required.

Figure 4-8 illustrates the functional model for CC1 and CC2 for a Source that supports [USB PD PR_Swap](#).

Figure 4-8 Source Functional Model Supporting USB PD PR_Swap

4.5.1.3.2 Sink Configuration Channel Functional Model

Figure 4-9 illustrates the functional model for CC1 and CC2 for a Sink. This illustration includes consideration for both USB Type-C Current and [USB PD](#).

Figure 4-9 Sink Functional Model for CC1 and CC2

Referring to Figure 4-9, a port that behaves as a Sink has the following functional characteristics:

1. The Sink terminates both CC1 and CC2 to GND using pull-down resistors.
2. The Sink determines that a Source is attached by the presence of power on VBUS.
3. The Sink uses the CC pin pull-up characteristic to detect and establish the correct routing for the USB SuperSpeed data path.
4. The Sink can optionally monitor CC to detect an available higher USB Type-C Current from the Source. The Sink shall manage its load to stay within the detected Source current limit.
5. If the Sink supports advanced functions (USB Power Delivery and/or Alternate Modes), [USB PD](#) communication is required.

Figure 4-10 illustrates the functional model for CC1 and CC2 for a Sink that supports [USB PD](#) PR_Swap and supports [USB PD](#) VCONN_Swap prior to attach.

Figure 4-10 UFPSSink Functional Model Supporting USB PD PR_Swap and VCONN_Swap

4.5.1.3.3 Dual-Role-Power (DRP) Configuration Channel Functional Model

Figure 4-11 illustrates the functional model for CC1 and CC2 for a DRP presenting as a Source prior to attach. This illustration includes consideration for both the USB Type-C Current and the [USB PD](#) features.

Figure 4-11 DRP Functional Model for CC1 and CC2

Referring to Figure 4-11, a port that can alternate between DFP and UFP behaviors has the following functional characteristics:

1. The DRP uses a FET to enable/disable power delivery across VBUS and initially when in Source mode has VBUS disabled.

2. The DRP uses switches for presenting as a Source or Sink.
3. The DRP has logic used during initial attach to toggle between Source and Sink operation:
 - a. Until a specific stable state is established, the DRP alternates between exposing itself as a Source and Sink. The timing of this process is dictated by a period ([tDRP](#)), percentage of time that a DRP exposes [Rp](#) ([dcSRC.DRP](#)) and role transition time ([tDRPTransition](#)).
 - b. When the DRP is presenting as a Source, it follows Source operation to detect an attached Sink – if a Sink is detected, it applies VBUS, VCONN, and continues to operate as a Source ~~for a minimum of~~ (e.g., cease alternating).
 - c. When the DRP is presenting as a Sink, it monitors VBUS to detect that it is attached to a Source – if a Source is detected, it continues to operate as a Sink (cease alternating).
4. If the DRP supports advanced functions (USB Power Delivery and/or Alternate Modes), [USB PD](#) communication is required.

4.5.1.4 USB Type-C Port Power Roles and Role Swapping Mechanisms

USB Type-C ports on products (USB hosts, USB devices, USB chargers, etc.) can be generally characterized as implementing one of seven power role behavioral models:

- Source-only
- Source (Default) – strong preference toward being a Source but subsequently capable of becoming a Sink using USB PD swap mechanisms.
- Sink-only
- Sink (Default) – strong preference toward being a Sink but subsequently capable of becoming a Source using USB PD swap mechanisms.
- DRP: Toggling (Source/Sink)
- DRP: Sourcing Device
- DRP: Sinking Host

Two independent sets of swapping mechanisms are defined for USB Type-C port implementations, one based on role swapping within the initial state machine connection process and the other based on subsequent use of [USB PD](#)-based swapping mechanisms.

4.5.1.4.1 USB Type-C State-Machine-Based Role Swapping

During the initial USB Type-C state machine connection process, the products being connected end up in one of the two following roles associated with the termination of its port:

- Rp → VBUS and VCONN source and behaving as a downstream facing port (USB Host)
- Rd → VBUS sink and behaving as an upstream facing port (USB Device)

A USB Type-C DRP-based product may incorporate either or both the [Try.SRC](#) and [Try.SNK](#) swap mechanisms to affect the resulting role. [Try.SRC](#) allows a DRP that has a policy-based preference to be a Source when connecting to another DRP to effect a transition from a destined Sink role to the Source role. Alternately, [Try.SNK](#) allows a DRP that has a policy-based preference to be a Sink when connecting to another DRP to effect a transition from a destined Source role to the Sink role. Connection timing and other factors are involved in this process as defined in the USB Type-C state machine operation (see Section 4.5.2). It is

important to note that these mechanisms, [Try.SRC](#) and [Try.SNK](#), can only be used once as part of the initial connection process.

[Try.SRC](#) and [Try.SNK](#) are intended to ensure more predictable power roles when initially connecting two DRPs, especially if the port partner does not support [USB PD](#). For example, a small mobile device may want to implement [Try.SNK](#), so that when attaching to a DRP laptop, the mobile device will always initially be the power sink. Similarly, a laptop or Power Bank may wish to implement [Try.SRC](#) to ensure it always sources power to attached DRPs. Self-powered devices such as AMAs or those whose primary function is a data UFP may also consider implementing [Try.SNK](#) to ensure they can properly expose their functionality. If both sides support [USB PD](#), the appropriate roles may then be further refined or swapped as per the [USB PD](#) and are intended for lower complexity products that may have a need to swap functional roles when connecting to another multi-role product but otherwise doesn't benefit from implementing, e.g. connecting two phones together for exchanging data and establishing the phone with active user input in the "host" role.

[specification](#).

4.5.1.4.2 USB PD-based Power Role, Data Role and VCONN Swapping

Following the completion of the initial USB Type-C state machine connection process, products may use [USB PD](#)-based swapping mechanisms to command a change power roles, data roles and which end of the cable will supply VCONN. These mechanisms are:

- [USB PD](#) PR_Swap : swaps Source ([Rp](#)) and Sink ([Rd](#))
- [USB PD](#) DR_Swap : swaps DFP (host data) and UFP (device data) roles
- [USB PD](#) VCONN_Swap : swaps which port supplies VCONN

Table 4-12 summarizes the behaviors of a port in response to the three [USB PD](#) swap commands.

Table 4-12 USB PD Swapping Port Behavior Summary

	DFP/UFP Data Roles	Rp/Rd	VBUS Source/Sink	VCONN Source
PR_Swap	Unchanged	Swapped	Swapped	Unchanged
DR_Swap	Swapped	Unchanged	Unchanged	Unchanged
VCONN_Swap	Unchanged	Unchanged	Unchanged	Swapped*

* Swapping of VCONN source port

4.5.1.4.3 Power Role Behavioral Model Summary

Table 4-13 provides a summary of the defining characteristics of the seven fundamental power roles.

Table 4-13 Power Role Behavioral Model Summary

Power Role	Toggles	PR_Swap	USB_Host	USB_Device	DFP	UFP	DR_Swap	Try_SRC/ Try_SNK	Connects with
Source-Only	No	NA	Opt.	Opt. ¹	Req.	Opt.	Opt.	NA	Sink/ DRP
Source (Default)	No	Req.	Opt.	Opt. ¹	Req.	Opt.	Opt.	NA	Sink/ DRP
Sink-Only	No	NA	Opt. ¹	Opt.	Opt.	Req.	Opt.	NA	Source/ DRP
Sink (Default)	No	Req.	Opt. ¹	Opt.	Opt.	Req.	Opt.	NA	Source/ DRP
Toggling (Source/Sink)		Req.	Req.	Opt.	Opt.	Req.	Req.	Opt. if no PD support	Source/ Sink/ DRP
DRP	Sourcing Device		Req.	NA	Req.	Req.	Req.	NA Opt.	
	Sinking Host		Req.	Req.	NA	Req.	Req.	NA Opt.	

Note: 1. Requires use of DR_Swap

4.5.2 CC Functional and Behavioral Requirements

This section provides the functional and behavioral requirements for implementing CC. The first sub-section provides connection state diagrams that are the basis for the remaining sub-sections.

The terms Source (SRC) and Sink (SNK) used in this section refer to the port's power role while the terms DFP and UFP refer to the port's data role. A DRP (Dual-Role-Power) port is capable of acting as either a Source or Sink. Typically Sources are found on hosts and supply VBUS while a Sink is found on a device and consumes power from VBUS. When a connection is initially made, the port's initial power state and data role are established. [USB PD](#) introduces three swap commands that may alter a port's power or data role:

- The PR_Swap command changes the port's power state as reflected in the following state machines. PR_Swap does not change the port sourcing VCONN.
- The DR_Swap command has no effect on the following state machines or VCONN as it only changes the port's data role.
- VCONN_Swap command changes the port sourcing VCONN. The PR_Swap command and DR_Swap command have no effect on the port sourcing VCONN.

Note: [USB PD](#) defines another optional swapping mechanism (FR_Swap) that is used in a special case where a user interaction could inadvertently trigger a need to change the source of VBUS. A variant of PR_Swap, FR_Swap similarly swaps Source ([Rp](#)) and Sink ([Rd](#)) between two connected ports. For purposes of this specification, only PR_Swap is explicitly considered in the behavior requirements and implementations that support FR_Swap should, where applicable, apply PR_Swap-related behaviors to FR_Swap. See the [USB PD](#) specification for further details regarding FR_Swap.

The connection state diagrams and CC behavior descriptions in this section describe the behavior of receptacle-based ports. The plug on a direct connect device or a device with a captive cable shall behave as a plug on a cable that is attached at its other end in normal orientation to a receptacle. These devices shall apply and sense CC voltage levels on pin A5 only and pin B5 shall have an impedance above [zOPEN](#), unless it is a [VCONN-Powered Accessory](#), in which case B5 shall have an impedance [Ra](#).

4.5.2.1 Connection State Diagrams

This section provides reference connection state diagrams for CC-based behaviors.

Refer to Section 4.5.2.2 for the specific state transition requirements related to each state shown in the diagrams.

Refer to Section 4.5.2.4 for a description of which states are mandatory for each port type, and a list of states where [USB PD](#) communication is permitted.

Figure 4-12 illustrates a connection state diagram for a Source (Host/Hub DFP).

Figure 4-15 illustrates a connection state diagram for a simple DRP (Dual-Role-Power) port.

Figure 4-15 Connection State Diagram: DRP

Figure 4-16 illustrates a connection state diagram for a DRP that supports [Try.SRC](#) and Accessory Modes.

Figure 4-16 Connection State Diagram: DRP with Accessory and Try.SRC Support

Figure 4-17 illustrates a connection state diagram for a DRP that supports Try.SNK and Accessory Modes.

Figure 4-17 Connection State Diagram: DRP with Accessory and Try.SNK Support

4.5.2.2 Connection State Machine Requirements

Entry into any unattached state when “directed from any state” shall not be used to override tDRP toggle.

A DRP or a Sink may consume default power from VBUS in any state where it is not required to provide VBUS.

The following two tables define the electrical states for a CC pin in both a Source and a Sink. Every port has CC1 and CC2 pins, each with its own individual CC pin state. The combination of a port's CC1 and CC2 pin states are be used to define the conditions under which a port transitions from one state to another.

Table 4-14 Source Port CC Pin State

CC Pin State	Port partner CC Termination	Voltage Detected on CC when port asserts Rp
SRC.Open	Open, Rp	Above vOPEN
SRC.Rd	Rd	Within the vRd range (i.e., between minimum vRd and maximum vRd)
SRC.Ra	Ra	Below maximum vRa

Table 4-15 Sink Port CC Pin State

CC Pin State	Port partner CC Termination	Voltage Detected on CC when port asserts Rd
SNK.Rp	Rp	Above minimum vRd-Connect
SNK.Open	Open, Ra, Rd	Below maximum vRa

4.5.2.2.1 Disabled State

This state appears in Figure 4-12, Figure 4-13, Figure 4-14, Figure 4-15, Figure 4-16 and Figure 4-17.

The [Disabled](#) state is where the port prevents connection from occurring by removing all terminations from the CC pins.

The port should transition to the [Disabled](#) state from any other state when directed. [When the port transitions to the Disabled state from Attached.SNK, it shall keep all terminations on the CC pins removed for a minimum of tErrorRecovery.](#)

A port may choose not to support the [Disabled](#) state. If the [Disabled](#) state is not supported, the port shall be directed to either the [Unattached.SNK](#) or [Unattached.SRC](#) states after power-on.

4.5.2.2.1.1 Disabled State Requirements

The port shall not drive VBUS or VCONN, and shall present a high-impedance to ground (above [zOPEN](#)) on its CC1 and CC2 pins.

4.5.2.2.1.2 Exiting From Disabled State

A Sink shall transition to [Unattached.SNK](#) when directed.

A Source shall transition to [Unattached.SRC](#) when directed.

A DRP shall transition to either [Unattached.SNK](#) or [Unattached.SRC](#) when directed.

4.5.2.2.2 ErrorRecovery State

This state appears in Figure 4-12, Figure 4-13, Figure 4-14, Figure 4-15, Figure 4-16 and Figure 4-17.

The [ErrorRecovery](#) state is where the port removes the terminations from the CC1 and CC2 pins for [tErrorRecovery](#) followed by transitioning to the appropriate [Unattached.SNK](#) or [Unattached.SRC](#) state based on port type. This is the equivalent of forcing a detach event and looking for a new attach.

The port should transition to the [ErrorRecovery](#) state from any other state when directed.

A port may choose not to support the [ErrorRecovery](#) state. If the [ErrorRecovery](#) state is not supported, the port shall be directed to the [Disabled](#) state if supported. If the [Disabled](#) state is not supported, the port shall be directed to either the [Unattached.SNK](#) or [Unattached.SRC](#) states.

4.5.2.2.2.1 ErrorRecovery State Requirements

The port shall not drive VBUS or VCONN, and shall present a high-impedance to ground (above [zOPEN](#)) on its CC1 and CC2 pins.

4.5.2.2.2.2 Exiting From ErrorRecovery State

A Sink shall transition to [Unattached.SNK](#) after [tErrorRecovery](#).

A Source shall transition to [Unattached.SRC](#) after [tErrorRecovery](#).

A DRP (Figure 4-15) and a DRP with Accessory and Try.SNK Support (Figure 4-17) shall transition to [Unattached.SNK](#) either after [tErrorRecovery](#).

[A DRP with Accessory and Try.SRC Support \(Figure 4-16 or\)](#) shall transition to [Unattached.SRC](#) after [tErrorRecovery](#).

4.5.2.2.3 Unattached.SNK State

This state appears in Figure 4-13, Figure 4-14, Figure 4-15, Figure 4-16 and Figure 4-17.

When in the [Unattached.SNK](#) state, the port is waiting to detect the presence of a Source.

A port with a dead battery shall enter this state while unpowered.

4.5.2.2.3.1 Unattached.SNK Requirements

The port shall not drive VBUS or VCONN.

Both CC1 and CC2 pins shall be independently terminated to ground through [Rd](#).

4.5.2.2.3.2 Exiting from Unattached.SNK State

If the port supports [USB PD](#) or accessories, the port shall transition to [AttachWait.SNK](#) when a Source connection is detected, as indicated by the [SNK.Rp](#) state on at least one of its CC pins.

A USB 2.0 only Sink that doesn't support accessories and is self-powered or requires only default power and does not support [USB PD](#) may transition directly to [Attached.SNK](#) when VBUS is detected.

A DRP shall transition to [Unattached.SRC](#) within [tDRPTransition](#) after the state of both CC pins is [SNK.Open](#) for [tDRP](#) – [dcSRC.DRP](#) · [tDRP](#), or if directed.

A Sink with Accessory support shall transition to [Unattached.Accessory](#) within [tDRPTransition](#) after the state of both the CC1 and CC2 pins is [SNK.Open](#) for [tDRP](#) – [dcSRC.DRP](#) · [tDRP](#), or if directed.

4.5.2.2.4 AttachWait.SNK State

This state appears in Figure 4-13, Figure 4-14, Figure 4-15, Figure 4-16 and Figure 4-17.

When in the [AttachWait.SNK](#) state, the port has detected the [SNK.Rp](#) state on at least one of its CC pins and is waiting for VBUS.

4.5.2.2.4.1 AttachWait.SNK Requirements

The port shall not drive VBUS or VCONN.

Both the CC1 and CC2 pins shall be independently terminated to ground through [Rd](#).

It is strongly recommended that a USB 3.1 SuperSpeed device hold off VBUS detection to the device controller until the [Attached.SNK](#) state or the [DebugAccessory.SNK](#) state is reached, i.e. at least one CC pin is in the [SNK.Rp](#) state. Otherwise, it may connect as USB 2.0 when attached to a legacy host or hub's DFP.

4.5.2.2.4.2 Exiting from AttachWait.SNK State

A Sink shall transition to [Unattached.SNK](#) when the state of both the CC1 and CC2 pins is [SNK.Open](#) for at least [tPDDebounce](#).

A DRP shall transition to [Unattached.SRC](#) when the state of both the CC1 and CC2 pins is [SNK.Open](#) for at least [tPDDebounce](#).

The port shall transition to [Attached.SNK](#) after the state of only one of the CC1 or CC2 pins is [SNK.Rp](#) for at least [tCCDebounce](#) and VBUS is detected. Note the Source may initiate [USB PD](#) communications which will cause brief periods of the [SNK.Open](#) state on one of the CC pins with the state of the other CC pin remaining [SNK.Open](#), but this event will not exceed [tPDDebounce](#).

If the port is a VCONN-Powered Accessory or a VCONN-Powered USB Device, the port shall transition to Attached.SNK when either VCONN or VBUS is detected. The port may transition without waiting tCCDebounce on CC.

If the port supports [Debug Accessory Mode](#), the port shall transition to [DebugAccessory.SNK](#) if the state of both the CC1 and CC2 pins is [SNK.Rp](#) for at least [tCCDebounce](#) and VBUS is detected. Note the DAM Source may initiate [USB PD](#) communications which will cause brief periods of the [SNK.Open](#) state on one of the CC pins with the state of the other CC pin remaining [SNK.Rp](#), but this event will not exceed [tPDDebounce](#).

A DRP that strongly prefers the Source role may optionally transition to [Try.SRC](#) instead of [Attached.SNK](#) when the state of only one CC pin has been [SNK.Rp](#) for at least [tCCDebounce](#) and VBUS is detected.

4.5.2.2.5 Attached.SNK State

This state appears in Figure 4-13, Figure 4-14, Figure 4-15, Figure 4-16 and Figure 4-17.

When in the [Attached.SNK](#) state, the port is attached and operating as a Sink. When the port initially enters this state it is also operating as a UFP. The power and data roles can be changed using [USB PD](#) commands.

A port that entered this state directly from [Unattached.SNK](#) due to detecting VBUS shall not determine orientation or availability of higher than Default USB Power and shall not use [USB PD](#).

4.5.2.2.5.1 Attached.SNK Requirements

If the port needs to determine the orientation of the connector, it shall do so only upon entry to this state by detecting which of the CC1 or CC2 pins is connected through the cable (i.e., the CC pin that is in the [SNK.Rp](#) state).

If the port supports signaling on USB SuperSpeed pairs, it shall functionally connect the USB SuperSpeed pairs and maintain the connection during and after a [USB PD](#) PR_Swap.

If the port has entered the [Attached.SNK](#) state from the [AttachWait.SNK](#) or [TryWait.SNK](#) states, only one the CC1 or CC2 pins will be in the [SNK.Rp](#) state. The port shall continue to terminate this CC pin to ground through [Rd](#).

If the port has entered the [Attached.SNK](#) state from the [Attached.SRC](#) state following a [USB PD](#) PR_Swap, the port shall terminate the connected CC pin to ground through [Rd](#).

The port shall meet the [Sink Power Sub-State](#) requirements specified in Section 4.5.2.3.

If the port is a VCONN-Powered USB Device, it shall respond to [USB PD](#) cable identity queries on SOP'. It shall not send or respond to messages on SOP. It shall ensure there is sufficient capacitance on CC to meet cReceiver as defined in [USB PD](#).

The port may negotiate a [USB PD](#) PR_Swap, DR_Swap or VCONN_Swap.

By default, upon entry from [AttachWait.SNK](#) or [Unattached.SNK](#), VCONN shall not be supplied in the [Attached.SNK](#) state. If [Attached.SNK](#) is entered from [Attached.SRC](#) as a result of a [USB PD](#) PR_Swap, it shall maintain VCONN supply state, whether on or off, and its data role/connections. A [USB PD](#) DR_Swap has no effect on which port sources VCONN.

The port may negotiate a [USB PD](#) VCONN_Swap. When the port successfully executes [USB PD](#) VCONN_Swap operation and was not sourcing VCONN, it shall start sourcing VCONN within [tVCONNON](#). The port shall execute the VCONN_Swap in a make-before-break sequence in order to keep active USB Type-C to USB Type-C cables powered. When the port successfully executes [USB PD](#) VCONN_Swap operation and was sourcing VCONN, it shall stop sourcing VCONN within [tVCONNOFF](#).

4.5.2.2.5.2 Exiting from Attached.SNK State

A port that is not a [VCONN-Powered USB Device](#) and is not in the process of a [USB PD](#) PR_Swap or a [USB PD](#) Hard Reset or a [USB PD FR Swap](#) shall transition to [Unattached.SNK](#) within [tSinkDisconnect](#) when VBUS falls below [vSinkDisconnect](#) 3.67 V. Note if for VBUS operating at or below 5 V or below [vSinkDisconnect](#) has been adjusted PD when negotiated by [USB PD](#) to operate above 5 V.

A VCONN-Powered USB Device shall return to [Unattached.SNK](#) when VBUS has fallen below [vSinkDisconnect](#) and VCONN has fallen below [vVCONNDISCONNECT](#), then the.

A port that has entered into USB PD communications with the Source and has seen the CC voltage exceed vRd-USB may monitor the CC pin to detect cable disconnect in addition to monitoring VBUS.

A port that is monitoring the CC voltage for disconnect (but is not in the process of a USB PD PR Swap or USB PD FR Swap) shall transition to Unattached.SNK within tSinkDisconnect when VBUS falls after the CC voltage remains below vRd-USB for tPDDebounce 80% of the negotiated value.

If supplying VCONN, the port shall cease to supply it within tVCONNOFF of exiting Attached.SNK.

After receiving a USB PD PS_RDY from the original Source during a USB PD PR_Swap, the port shall transition directly to the Attached.SRC state (i.e., remove Rd from CC, assert Rp on CC and supply VBUS), but shall maintain its VCONN supply state, whether off or on, and its data role/connections.

4.5.2.2.6 UnattachedWait.SRC State

This state appears in Figure 4-12.

When in the UnattachedWait.SRC state, the port is discharging the CC pin that was providing VCONN in the previous Attached.SRC state.

4.5.2.2.6.1 UnattachedWait.SRC Requirements

The port shall not enable VBUS or VCONN.

The port shall complete the VCONN turn off initiated when leaving the previous Attached.SRC state.

The port shall continue to provide an Rp termination, as specified in Table 4-20, on the CC pin not being discharged.

The port shall not provide an Rp termination on the CC pin being discharged.

The port shall provide an Rdch termination on the CC pin being discharged.

The port shall discharge the CC pin being discharged below vVCONNDischarge.

4.5.2.2.6.2 Exiting from UnattachedWait.SRC State

The port shall transition to Unattached.SRC when both VCONN is turned off and the CC pin is below vVCONNDischarge.

4.5.2.2.6.4.5.2.2.7 Unattached.SRC State

This state appears in Figure 4-12, Figure 4-15, Figure 4-16 and Figure 4-17.

When in the Unattached.SRC state, the port is waiting to detect the presence of a Sink or an Accessory.

4.5.2.2.6.4.5.2.2.7.1 Unattached.SRC Requirements

The port shall not drive VBUS or VCONN.

The port shall source current on both the CC1 and CC2 pins independently.

The port shall provide a separate [Rp](#) termination on the CC1 and CC2 pins as specified in Table 4-20. Note: A ~~direct connected~~ Source ~~e.g. with~~ a captive ~~cabled product~~ cable or just [a plug](#) presents a single [Rp](#) termination on its CC pin (A5).

[4.5.2.2.6.24.5.2.2.7.2](#) Exiting from Unattached.SRC State

The port shall transition to [AttachWait.SRC](#) when [V_{bus} is vSafe0V](#) and:

- The [SRC.Rd](#) state is detected on either CC1 or CC2 pin or
- The [SRC.Ra](#) state is detected on both the CC1 and CC2 pins.

Note: A cable without an attached device can be detected, when the [SRC.Ra](#) state is detected on one of the CC1 or CC2 pins and the other CC pin is [SRC.Open](#). However in this case, the port shall not transition to [AttachWait.SRC](#).

A DRP shall transition to [Unattached.SNK](#) within [tDRPTransition](#) after $dcSRC.DRP \cdot tDRP$, or if directed.

[4.5.2.2.74.5.2.2.8](#) AttachWait.SRC State

This state appears in Figure 4-12, Figure 4-15, Figure 4-16 and Figure 4-17.

The [AttachWait.SRC](#) state is used to ensure that the state of both of the CC1 and CC2 pins is stable after a Sink is connected.

[4.5.2.2.7.14.5.2.2.8.1](#) AttachWait.SRC Requirements

The requirements for this state are identical to [Unattached.SRC](#).

[4.5.2.2.7.24.5.2.2.8.2](#) Exiting from AttachWait.SRC State

The port shall transition to [Attached.SRC](#) when V_{bus} is at vSafe0V and the [SRC.Rd](#) state is detected on exactly one of the CC1 or CC2 pins for at least [tCCDebounce](#).

If the port supports [Audio Adapter Accessory Mode](#), it shall transition to [AudioAccessory](#) when the [SRC.Ra](#) state is detected on both the CC1 and CC2 pins for at least [tCCDebounce](#).

If the port supports [Debug Accessory Mode](#), it shall transition to [UnorientedDebugAccessory.SRC](#) when [V_{bus} is at vSafe0V](#) and the [SRC.Rd](#) state is detected on both the CC1 and CC2 pins for at least [tCCDebounce](#).

A Source shall transition to [Unattached.SRC](#) and a DRP to [Unattached.SNK](#) when the [SRC.Open](#) state is detected on both the CC1 and CC2 pins. [The Source shall detect the SRC.Open state within tSRCDisconnect, but should detect it as quickly as possible.](#)

A Source shall transition to [Unattached.SRC](#) and a DRP to [Unattached.SNK](#) when the [SRC.Open](#) state is detected on either the CC1 or CC2 pin and the other CC pin is [SRC.Ra](#). [The Source shall detect the SRC.Open state within tSRCDisconnect, but should detect it as quickly as possible.](#)

A DRP that strongly prefers the Sink role may optionally transition to [Try.SNK](#) instead of [Attached.SRC](#) when V_{bus} is at vSafe0V and the [SRC.Rd](#) state is detected on exactly one of the CC1 or CC2 pins for at least [tCCDebounce](#).

[4.5.2.2.84.5.2.2.9](#) Attached.SRC State

This state appears in Figure 4-12, Figure 4-15, Figure 4-16 and Figure 4-17.

When in the [Attached.SRC](#) state, the port is attached and operating as a Source. When the port initially enters this state it is also operating as a DFP. Subsequently, the initial power and data roles can be changed using [USB PD](#) commands.

4.5.2.2.8.14.5.2.2.9.1 Attached.SRC Requirements

If the port needs to determine the orientation of the connector, it shall do so only upon entry to the [Attached.SRC](#) state by detecting which of the CC1 or CC2 pins is connected through the cable, i.e., which CC pin is in the [SRC.Rd](#) state.

If the port has entered this state from the [AttachWait.SRC](#) state or the [Try.SRC](#) state, the [SRC.Rd](#) state will be on only one of the CC1 or CC2 pins. The port shall source current on this CC pin and monitor its state.

If the port has entered this state from the [Attached.SNK](#) state as the result of a [USB PD](#) PR_Swap, the port shall source current on the connected CC pin and monitor its state.

The port shall provide an [Rp](#) as specified in Table 4-20.

The port shall supply VBUS current at the level it advertises on [Rp](#).

The port shall supply VBUS within [tVBUSON](#) of entering this state, and for as long as it is operating as a power source.

The port shall not initiate any [USB PD](#) communications until VBUS reaches vSafe5V.

If the port supports signaling on USB SuperSpeed pairs, it shall:

- Functionally connect the USB SuperSpeed pairs
- For VCONN, do one of two things:
 - [ApplySupply](#) VCONN unconditionally to the CC pin not in the [SRC.Rd](#) state, or
 - [ApplySupply](#) VCONN to the CC pin in the [SRC.Ra](#) state.

A port that does not support signaling on USB SuperSpeed pairs may supply VCONN in the same manner described above.

The port may negotiate a [USB PD](#) PR_Swap, DR_Swap or VCONN_Swap.

If the port supplies VCONN, it shall do so within [tVCONNON](#).

[The port may query the identity of the cable via USB PD on SOP'. If it detects that it is connected to a VCONN-Powered USB Device, the port may remove VBUS and discharge it to vSafe0V, while continuing to remain in this state with VCONN applied. The port may also initiate other SOP' communication, such as to update the VPD firmware.](#)

The port shall not supply VCONN if it has entered this state as a result of a [USB PD](#) PR_Swap and was not previously supplying VCONN. A [USB PD](#) DR_Swap has no effect on which port sources VCONN.

The port may negotiate a [USB PD](#) VCONN_Swap. When the port successfully executes [USB PD](#) VCONN_Swap operation and was sourcing VCONN, it shall stop sourcing VCONN within [tVCONNOFF](#). The port shall execute the VCONN_Swap in a make-before-break sequence in order to keep active USB Type-C to USB Type-C cables powered. When the port successfully executes [USB PD](#) VCONN_Swap operation and was not sourcing VCONN, it shall start sourcing VCONN within [tVCONNON](#).

4.5.2.2.8.24.5.2.2.9.2 Exiting from Attached.SRC State

A Source that is supplying VCONN shall transition to UnattachedWait.SRC when the SRC.Open state is detected on the monitored CC pin. The Source shall detect the SRC.Open state within tSRCDisconnect, but should detect it as quickly as possible.

A Source that is not supplying VCONN shall transition to Unattached.SRC when the SRC.Open state is detected on the monitored CC pin. The Source shall detect the SRC.Open state within tSRCDisconnect, but should detect it as quickly as possible.

When the SRC.Open state is detected on the monitored CC pin, a DRP shall transition to Unattached.SNK unless it strongly prefers the Source role. In that case, it shall transition to TryWait.SNK. This transition to TryWait.SNK is needed so that two devices that both prefer the Source role do not loop endlessly between Source and Sink. In other words, a DRP that would enter Try.SRC from AttachWait.SNK shall enter TryWait.SNK for a Sink detach from Attached.SRC.

A port shall cease to supply VBUS within tVBUSOFF of exiting Attached.SRC.

A port that is supplying VCONN shall cease to supply it within tVCONNOFF of exiting Attached.SRC, unless it is exiting as a result of a USB PD PR_Swap.

After a USB PD PR_Swap is accepted (i.e., either an Accept message is received or acknowledged), a DRP shall transition directly to the Attached.SNK state (i.e., remove Rp from CC, assert Rd on CC and stop supplying VBUS) and maintain its current data role, connection and VCONN supply state.

4.5.2.2.94.5.2.2.10 Try.SRC State

This state appears in Figure 4-16.

When in the Try.SRC state, the port is querying to determine if the port partner supports the Sink role.

Note: if both Try.SRC and Try.SNK mechanisms are implemented, only one shall be enabled by the port at any given time. Deciding which of these two mechanisms is enabled is product design-specific.

4.5.2.2.9.14.5.2.2.10.1 Try.SRC Requirements

The port shall not drive VBUS or VCONN.

The port shall source current on both the CC1 and CC2 pins independently.

The port shall provide an Rp as specified in Table 4-20.

4.5.2.2.9.24.5.2.2.10.2 Exiting from Try.SRC State

The port shall transition to Attached.SRC when the SRC.Rd state is detected on exactly one of the CC1 or CC2 pins for at least tTryCCDebounce.

The port shall transition to TryWait.SNK after tDRPTry and the SRC.Rd state has not been detected and VBUS is within vSafe0V, or after tTryTimeout and the SRC.Rd state has not been detected.

4.5.2.2.104.5.2.2.11 TryWait.SNK State

This state appears in Figure 4-16.

When in the [TryWait.SNK](#) state, the port has failed to become a Source and is waiting to attach as a Sink. Alternatively the port is responding to the Sink being removed while in the [Attached.SRC](#) state.

4.5.2.2.10.14.5.2.2.11.1 TryWait.SNK Requirements

The port shall not drive VBUS or VCONN.

Both the CC1 and CC2 pins shall be independently terminated to ground through [Rd](#).

4.5.2.2.10.24.5.2.2.11.2 Exiting from TryWait.SNK State

The port shall transition to [Attached.SNK](#) after [tCCDebounce](#) if or when VBUS is detected. Note the Source may initiate [USB PD](#) communications which will cause brief periods of the [SNK.Open](#) state on both the CC1 and CC2 pins, but this event will not exceed [tPDDebounce](#).

The port shall transition to [Unattached.SNK](#) when the state of both of the CC1 and CC2 pins is [SNK.Open](#) for at least [tPDDebounce](#).

4.5.2.2.11.14.5.2.2.12 Try.SNK State

This state appears in Figure 4-14 and Figure 4-17.

When in the [Try.SNK](#) state, the port is querying to determine if the port partner supports the Source role.

Note: if both [Try.SRC](#) and [Try.SNK](#) mechanisms are implemented, only one shall be enabled by the port at any given time. Deciding which of these two mechanisms is enabled is product design-specific.

4.5.2.2.11.14.5.2.2.12.1 Try.SNK Requirements

The port shall not drive VBUS or VCONN.

Both the CC1 and CC2 pins shall be independently terminated to ground through [Rd](#).

4.5.2.2.11.24.5.2.2.12.2 Exiting from Try.SNK State

The port shall wait for [tDRPTry](#) and only then begin monitoring the CC1 and CC2 pins for the [SNK.Rp](#) state.

The port shall then transition to [Attached.SNK](#) when the [SNK.Rp](#) state is detected on exactly one of the CC1 or CC2 pins for at least [tTryCCDebounce](#) and VBUS is detected.

Alternatively, the port shall transition to [TryWait.SRC](#) if [SNK.Rp](#) state is not detected for [tTryCCDebounce](#). A Sink with Accessory Support shall transition to [Unsupported.Accessory](#) if [SNK.Rp](#) state is not detected for [tDRPTryWait](#).

Note: The Source may initiate [USB PD](#) communications which will cause brief periods of the [SNK.Open](#) state on both the CC1 and CC2 pins, but this event will not exceed [tTryCCDebounce](#).

4.5.2.2.12.14.5.2.2.13 TryWait.SRC State

This state appears in Figure 4-17.

When in the [TryWait.SRC](#) state, the port has failed to become a Sink and is waiting to attach as a Source.

4.5.2.2.12.14.5.2.2.13.1 TryWait.SRC Requirements

The requirements for this state are identical to [Unattached.SRC](#).

4.5.2.2.12.24.5.2.2.13.2 Exiting from TryWait.SRC State

The port shall transition to [Attached.SRC](#) when VBUS is at vSafe0V and the [SRC.Rd](#) state is detected on exactly one of the CC pins for at least [tTryCCDebounce](#).

The port shall transition to [Unattached.SNK](#) after [tDRPTry](#) if neither of the CC1 or CC2 pins are in the [SRC.Rd](#) state.

4.5.2.2.13.4.5.2.2.14 Unattached.Accessory State

This state appears in Figure 4-14.

The [Unattached.Accessory](#) state allows accessory-supporting Sinks to connect to audio or [VCONN-Powered Accessories](#)~~VCONN powered accessories~~.

This state is functionally equivalent to the [Unattached.SRC](#) state in a DRP, except that [Attached.SRC](#) is not supported.

4.5.2.2.13.14.5.2.2.14.1 Unattached.Accessory Requirements

The port shall not drive VBUS or VCONN.

The port shall source current on both the CC1 and CC2 pins independently.

The port shall provide an [Rp](#) as specified in Table 4-20.

4.5.2.2.13.24.5.2.2.14.2 Exiting from Unattached.Accessory State

~~The A port that supports Audio Adapter Accessory Mode~~ shall transition to [AttachWait.Accessory](#) when the state of both ~~the CC1 and CC2~~ pins is [SRC.Ra](#) or [SRC.Rd](#).

A port that supports [VCONN-Powered Accessories](#)~~VCONN powered accessories~~ also shall transition to [AttachWait.Accessory](#) when the state of either CC1 or CC2 pin is [SRC.Ra](#) and the other CC pin is [SRC.Rd](#).

Otherwise, the port shall transition to [Unattached.SNK](#) within [tDRPTransition](#) after $dcSRC.DRP \cdot tDRP$, or if directed.

4.5.2.2.14.4.5.2.2.15 AttachWait.Accessory State

This state appears in Figure 4-14.

The [AttachWait.Accessory](#) state is used to ensure that the state of both of the CC1 and CC2 pins is stable after a cable is plugged in.

4.5.2.2.14.14.5.2.2.15.1 AttachWait.Accessory Requirements

The requirements for this state are identical to [Unattached.Accessory](#).

4.5.2.2.14.24.5.2.2.15.2 Exiting from AttachWait.Accessory State

If the port supports [Audio Adapter Accessory Mode](#), it shall transition to [AudioAccessory](#) when the state of both the CC1 and CC2 pins is [SRC.Ra](#) for at least [tCCDebounce](#).

The port shall transition to [Unattached.SNK](#) when the state of either the CC1 or CC2 pin is [SRC.Open](#) for at least [tCCDebounce](#).

If the port supports [VCONN-Powered Accessories](#), it shall transition to [PoweredAccessory](#) state if the state of either the CC1 or CC2 pin is [SRC.Rd](#) and the other CC pin is [SRC.Ra](#) concurrently for at least [tCCDebounce](#).

[4.5.2.2.15](#)[4.5.2.2.16](#) [AudioAccessory State](#)

This state appears in Figure 4-12, Figure 4-14, Figure 4-16 and Figure 4-17.

The AudioAccessory state is used for the [Audio Adapter Accessory Mode](#) specified in Appendix A.

[4.5.2.2.15](#)[4.5.2.2.16.1](#) [AudioAccessory Requirements](#)

The port shall reconfigure its pins as detailed in Appendix A.

The port shall not drive VBUS or VCONN. A port that sinks current from the audio accessory over VBUS shall not draw more than 500 mA.

The port shall provide an [Rp](#) as specified in Table 4-20.

The port shall source current on at least one of the CC1 or CC2 pins and monitor to detect when the state is no longer [SRC.Ra](#). If the port sources and monitors only one of CC1 or CC2, then it shall ensure that the termination on the unmonitored CC pin does not affect the monitored signal when the port is connected to an Audio Accessory that may short both CC1 and CC2 pins together.

[4.5.2.2.15](#)[4.5.2.2.16.2](#) [Exiting from AudioAccessory State](#)

If the port is a Sink, the port shall transition to [Unattached.SNK](#) when the state of the monitored CC1 or CC2 pin(s) is [SRC.Open](#) for at least [tCCDebounce](#).

If the port is a Source or DRP, the port shall transition to [Unattached.SRC](#) when the state of the monitored CC1 or CC2 pin(s) is [SRC.Open](#) for at least [tCCDebounce](#).

[4.5.2.2.16](#)[4.5.2.2.17](#) [UnorientedDebugAccessory.SRC](#)

This state appears in Figure 4-12, Figure 4-16 and Figure 4-17.

The [UnorientedDebugAccessory.SRC](#) state is used for the [Debug Accessory Mode](#) specified in Appendix B.

[4.5.2.2.16](#)[4.5.2.2.17.1](#) [UnorientedDebugAccessory.SRC Requirements](#)

This mode is for debug only and shall not be used for communicating with commercial products.

The port shall provide an [Rp](#) as specified in Table 4-20 on both the CC1 and CC2 pins and monitor to detect when the state of either is [SRC.Open](#).

The port shall supply VBUS current at the level it advertises on [Rp](#). The port shall not drive VCONN.

The port may connect any non-orientation specific debug signals for [Debug Accessory Mode](#) operation only after entry to this state.

[4.5.2.2.16](#)[4.5.2.2.17.2](#) [Exiting from UnorientedDebugAccessory.SRC State](#)

If the port is a Source, the port shall transition to [Unattached.SRC](#) when the [SRC.Open](#) state is detected on either the CC1 or CC2 pin.

If the port is a DRP, the port shall transition to [Unattached.SNK](#) when the [SRC.Open](#) state is detected on either the CC1 or CC2 pin.

The port shall transition to [OrientedDebugAccessory.SRC](#) state if orientation is required and detected as described in Section B.2.6.1.2.

[4.5.2.2.17](#)[4.5.2.2.18](#) [OrientedDebugAccessory.SRC State](#)

This state appears in Figure 4-12, Figure 4-16 and Figure 4-17.

The [OrientedDebugAccessory.SRC](#) state is used for the [Debug Accessory Mode](#) specified in Appendix B.

[4.5.2.2.17](#)[4.5.2.2.18.1](#) [OrientedDebugAccessory.SRC State Requirements](#)

This mode is for debug only and shall not be used for communicating with commercial products.

The port shall provide an [Rp](#) as specified in Table 4-20 on both the CC1 and CC2 pins and monitor to detect when the state of either is [SRC.Open](#).

The port shall supply VBUS current at the level it advertises on [Rp](#). The port shall not drive VCONN.

The port shall connect any orientation specific debug signals for [Debug Accessory Mode](#) operation only after entry to this state. Any non-orientation specific debug signals for [Debug Accessory Mode](#) operation shall be connected or remain connected in this state.

If the port needs to establish [USB PD](#) communications, it shall do so only after entry to this state. The port shall not initiate any [USB PD](#) communications until VBUS reaches vSafe5V. In this state, the port takes on the initial [USB PD](#) role of DFP/Source.

[4.5.2.2.17](#)[4.5.2.2.18.2](#) [Exiting from OrientedDebugAccessory.SRC State](#)

If the port is a Source, the port shall transition to [Unattached.SRC](#) when the [SRC.Open](#) state is detected on either the CC1 or CC2 pin.

If the port is a DRP, the port shall transition to [Unattached.SNK](#) when the [SRC.Open](#) state is detected on either the CC1 or CC2 pin.

[4.5.2.2.18](#)[4.5.2.2.19](#) [DebugAccessory.SNK](#)

This state appears in Figure 4-13, Figure 4-14, Figure 4-16 and Figure 4-17.

The [DebugAccessory.SNK](#) state is used for the [Debug Accessory Mode](#) specified in Appendix B.

[4.5.2.2.18](#)[4.5.2.2.19.1](#) [DebugAccessory.SNK Requirements](#)

This mode is for debug only and shall not be used for communicating with commercial products.

The port shall not drive VBUS or VCONN.

The port shall provide an [Rd](#) as specified in Table 4-21 on both the CC1 and CC2 pins and monitor to detect when the state of either is [SRC.Open](#).

If supported, orientation is determined as outlined in Section B.2.6.1.1. The port shall connect any debug signals for [Debug Accessory Mode](#) operation only after entry to this state.

4.5.2.2.18.24.5.2.2.19.2 Exiting from DebugAccessory.SNK State

The port shall transition to Unattached.SNK when VBUS is no longer present.

4.5.2.2.194.5.2.2.20 PoweredAccessory State

This state appears in Figure 4-14.

| When in the PoweredAccessory state, the port is powering a VCONN-Powered Accessory or VCONN-Powered USB Device.

4.5.2.2.19.14.5.2.2.20.1 PoweredAccessory Requirements

If the port needs to determine the orientation of the connector, it shall do so only upon entry to the PoweredAccessory state by detecting which of the CC1 or CC2 pins is connected through the cable (i.e., which CC pin is in the SRC.Rd state).

The SRC.Rd state is detected on only one of the CC1 or CC2 pins. The port shall advertise either 1.5 A or 3.0 A (see Table 4-20) on this CC pin and monitor its state.

| The port shall supply VCONN (2.7 V minimum) on the unused CC pin within tVconnON-PA of entering the PoweredAccessory state.

The port shall not drive VBUS.

When the port initially enters the PoweredAccessory state it shall operate as a DFP.

| The port shall do at least one of the following:

- Use USB Power Delivery Structured Vendor Defined Messages (Structured VDMs) to identify the accessory and enter an Alternate Mode.
- Use USB Power Delivery to query the identity of the cable to confirm that it is connected to a VCONN-Powered USB Device. The port may also initiate other SOP' communication, such as to update the VPD firmware.

4.5.2.2.19.24.5.2.2.20.2 Exiting from PoweredAccessory State

The port shall transition to Unattached.SNK when the SRC.Open state is detected on the monitored CC pin.

| The port shall transition to Try.SNK if the attached device is not a VCONN-Powered Accessory or VCONN-Powered USB Device. For example, the attached device does not support USB PD or does not respond to USB PD commands required for a VCONN-Powered Accessory (e.g., Discover SVIDs, Discover Modes, etc.) or is a Sink or DRP attached through a Powered Cable.

The port shall transition to Unsupported.Accessory if the attached device is a VCONN-Powered Accessory but the port has not successfully entered an Alternate Mode within tAMETimeout (see Section 5.1).

The port shall cease to supply VCONN within tVCONNOFF of exiting the PoweredAccessory state.

4.5.2.2.204.5.2.2.21 Unsupported.Accessory State

This state appears in Figure 4-14.

| If a VCONN-Powered Accessory VCONN-powered accessory does not enter an Alternate Mode, the Unsupported.Accessory state is used to wait until the accessory is unplugged before continuing.

4.5.2.2.20.14.5.2.2.21.1 UnsupportedAccessory Requirements

Only one of the CC1 or CC2 pins shall be in the [SRC.Rd](#) state. The port shall advertise Default USB Power (see Table 4-20) on this CC pin and monitor its voltage.

The port shall not drive VBUS or VCONN.

[A Sink with either VCONN-Powered Accessory or VCONN-Powered USB Device support shall provide user notification that it does not recognize or support the attached accessory or device.](#)

4.5.2.2.20.24.5.2.2.21.2 Exiting from UnsupportedAccessory

The port shall transition to [Unattached.SNK](#) when the [SRC.Open](#) state is detected on the monitored CC pin.

4.5.2.3 Sink Power Sub-State Requirements

When in the [Attached.SNK](#) state and the Source is supplying default VBUS, the port shall operate in one of the sub-states shown in Figure 4-18. The initial Sink Power Sub-State is [PowerDefault.SNK](#). Subsequently, the Sink Power Sub-State is determined by Source's USB Type-C current advertisement. The port in [Attached.SNK](#) shall remain within the Sink Power Sub-States until either VBUS is removed or a [USB PD](#) contract is established with the Source.

Figure 4-18 Sink Power Sub-States

The Sink is only required to implement Sink Power Sub-State transitions if the Sink wants to consume more than default USB current.

4.5.2.3.1 PowerDefault.SNK Sub-State

This sub-state supports Sinks consuming current within the lowest range (default) of Source-supplied current.

4.5.2.3.1.1 PowerDefault.SNK Requirements

The port shall draw no more than the default USB power from VBUS. See Section 4.6.2.1.

If the port wants to consume more than the default USB power, it shall monitor [vRd](#) to determine if more current is available from the Source.

4.5.2.3.1.2 Exiting from PowerDefault.SNK

For any change in vRd indicating a change in allowable power, the port shall not transition until the new vRd has been stable for at least tRpValueChange.

For a [vRd](#) in the [vRd-1.5](#) range, the port shall transition to the [Power1.5.SNK Sub-State](#).

For a **vRd** in the **vRd-3.0** range, the port shall transition to the **Power3.0.SNK Sub-State**.

4.5.2.3.2 Power1.5.SNK Sub-State

This sub-state supports Sinks consuming current within the two lower ranges (default and 1.5 A) of Source-supplied current.

4.5.2.3.2.1 Power1.5.SNK Requirements

The port shall draw no more than 1.5 A from VBUS.

The port shall monitor vRd while it is in this sub-state.

4.5.2.3.2.2 Exiting from Power1.5.SNK

~~4.5.2.3.2.21.1.1.1.1~~ Exiting from Power1.5.SNK

For any change in `vRd` indicating a change in allowable power, the port shall not transition until the new `vRd` has been stable for at least `tRpValueChange`.

For a [vRd](#) in the [vRd-USB](#) range, the port shall transition to the [PowerDefault.SNK](#) Sub-State and reduce its power consumption to the new range within [tSinkAdj](#).

For a **vRd** in the **vRd-3.0** range, the port shall transition to the [Power3.0.SNK Sub-State](#).

4.5.2.3.3 Power3.0.SNK Sub-State

This sub-state supports Sinks consuming current within all three ranges (default, 1.5 A and 3.0 A) of Source-supplied current.

4.5.2.3.3.1 Power3.0.SNK Requirements

The port shall draw no more than 3.0 A from VBUS.

The port shall monitor vRd while it is in this sub-state.

4.5.2.3.3.2 Exiting from Power3.0.SNK

For any change in `vRd` indicating a change in allowable power, the port shall not transition until the new `vRd` has been stable for at least `tRpValueChange`.

For a [vRd](#) in the [vRd-USB](#) range, the port shall transition to the [PowerDefault.SNK](#) Sub-State and reduce its power consumption to the new range within [tSinkAdj](#).

For a [vRd](#) in the [vRd-1.5](#) range, the port shall transition to the [Power1.5.SNK Sub-State](#) and reduce its power consumption to the new range within [tSinkAdj](#).

4.5.2.4 Cable State Machine Requirements

Figure 4-19 illustrates the passive cable eMarker connection state diagram. Figure 4-20 illustrates the active cable eMarker connection state diagram.

Figure 4-19 Passive Cable eMarker State Diagram

Figure 4-20 Active Cable eMarker State Diagram

4.5.2.4.1 Cable Power On State

This state appears in Figure 4-19 and Figure 4-20. This is the initial power on state for the eMarker in the cable when VCONN is applied.

4.5.2.4.1.1 Cable Power On State Requirements

The eMarker in the cable shall present Ra when no VCONN is applied.

The eMarker in the cable shall power on and may continue to present Ra in this state.

The cable shall not respond to SOP' and SOP" commands in this state.

4.5.2.4.1.2 Exiting from Cable Power On State

The eMarker in a passive cable shall transition to Assign SOP' when it has completed its boot process. The eMarker in the passive cable shall transition to Assign SOP' within tVCONNStable.

The eMarker in an active cable shall transition to Unassigned SOP when it has completed its boot process. The eMarker in the active cable shall transition to Unassigned SOP within tVCONNStable.

4.5.2.4.2 Unassigned SOP State

This state appears in Figure 4-20. The eMarker in the active cable can detect the voltage on VCONN in this state and is waiting to assign SOP' and SOP" if supported.

4.5.2.4.2.1 Unassigned SOP State Requirements

The eMarker in the active cable shall not respond to any USB PD communication sent to SOP' or SOP" while in this state.

The cable shall weaken or remove Ra if it has not already done so.

The Active cable shall meet the Power for Active Cables defined in Table 4-6.

The eMarker in the active cable shall detect VCONN on the local cable plug or on the remote cable plug.

4.5.2.4.2.2 Exiting from Unassigned SOP State

The eMarker in the active cable shall transition to Assign SOP' when it detects VCONN present on its local cable plug and no VCONN being received from the remote cable plug.

The eMarker in the active cable shall transition to Assign SOP" when it detects VCONN being received from the remote cable plug and it does not detect VCONN from its local cable plug. The eMarker in the active cable may stay in Unassigned SOP if it does not support SOP".

The eMarker in the active cable should remain in Unassigned SOP if it detects VCONN present on the local cable plug and the remote cable plug at the same time.

4.5.2.4.3 Assign SOP' State

This state appears in Figure 4-19 and Figure 4-20. The cable eMarker responds to SOP' in this state.

4.5.2.4.3.1 Assign SOP' State Requirements

The eMarker in the passive or active cable shall be able to respond to any USB PD communication sent to SOP'.

The eMarker in the passive cable shall weaken or remove Ra if it has not already done so.

Passive cables shall meet the Power for electronically marked passive cables defined in Table 4-6.

Active Cables shall meet the Power for Active cables in Table 4-6.

4.5.2.4.3.2 Exiting from Assign SOP' State

The eMarker in the passive or active cable shall transition to Cable Power On upon sensing VCONN less than vRaReconnect or upon a Power On Reset event.

The eMarker in the passive cable shall transition to Cable Power On upon sensing a Hard Reset or Cable Reset.

The eMarker in the active cable shall transition to Unassigned SOP upon sensing a Hard Reset or Cable Reset.

4.5.2.4.4 Assign SOP" State (Optional Normative)

This state appears in Figure 4-20. The active cable eMarker responds to SOP" in this state. This state is only required to be supported when a second eMarker is in the cable, i.e., when an eMarker is implemented at each end of the cable.

4.5.2.4.4.1 Assign SOP" State Requirements

The eMarker in the active cable shall be able to respond to any USB PD communication sent to SOP".

The eMarker shall weaken or remove Ra to meet the maximum power defined in Table 4-6 if it has not already done so.

4.5.2.4.4.2 Exiting from SOP" State

The eMarker in the active cable shall transition to Cable Power On upon sensing VCONN less than vRaReconnect or on a Power On Reset event.

The eMarker in the active cable shall transition to Unassigned SOP upon sensing a Hard Reset or Cable Reset.

4.5.2.4.5.2.5 Connection States Summary

Table 4-16 defines the mandatory and optional states for each type of port.

Table 4-16 Mandatory and Optional States

	SOURCE	SINK	DRP	USB PD Communication
Disabled	Optional	Optional	Optional	Not Permitted
ErrorRecovery	Optional	Optional	Optional	Not Permitted
Unattached.SNK	N/A	Mandatory	Mandatory	Not Permitted
AttachWait.SNK	N/A	Mandatory ¹	Mandatory	Not Permitted
Attached.SNK	N/A	Mandatory	Mandatory	Permitted
UnattachedWait.SRC	<u>Mandatory or N/A⁷</u>	<u>N/A</u>	<u>N/A</u>	<u>Not Permitted</u>
Unattached.SRC	Mandatory	N/A	Mandatory	Not Permitted
AttachWait.SRC	Mandatory	N/A	Mandatory	Not Permitted
Attached.SRC	Mandatory	N/A	Mandatory	Permitted
Try.SRC⁴	N/A	N/A	Optional	Not Permitted
TryWait.SNK²	N/A	N/A	Optional	Not Permitted
Try.SNK⁴	N/A	N/A	Optional	Not Permitted
TryWait.SRC⁵	N/A	N/A	Optional	Not Permitted
Accessory	Optional	Optional	Optional	Not Permitted
UnorientedDebugAccessory.SRC	Optional ⁶	N/A	Optional ⁶	Not Permitted
OrientedDebugAccessory.SRC	Optional ⁶	N/A	Optional ⁶	Permitted
DebugAccessory.SNK	N/A	Optional	Optional	Permitted
Unattached.Accessory	N/A	Optional	N/A	Not Permitted
AttachWait.Accessory	N/A	Optional	N/A	Not Permitted
PoweredAccessory	N/A	Optional	N/A	Permitted
Unsupported.Accessory³	N/A	Optional	N/A	Not Permitted
PowerDefault.SNK	N/A	Mandatory	Mandatory	Permitted
Power1.5.SNK	N/A	Optional	Optional	Permitted
Power3.0.SNK	N/A	Optional	Optional	Permitted

Note:

1. Optional for UFP applications that are USB 2.0-only, consume USB Default Power and do not support [USB PD](#) or accessories.
2. TryWait.SNK is mandatory when Try.SRC is supported.
3. Unsupported.Accessory is mandatory when PoweredAccessory is supported.
4. Try.SRC and Try.SNK shall not be supported at the same time, although an unattached device may dynamically choose between Try.SRC and Try.SNK state machines based on external factors.
5. TryWait.SRC is mandatory when Try.SNK is supported.
6. UnorientedDebugAccessory.SRC is required for any Source or DRP that supports Debug Accessory Mode.
OrientedDebugAccessory.SRC is only required if orientation detection is necessary in Debug Accessory Mode.
7. Mandatory for a DFP that was providing VCONN in the previous Attached.SRC state. N/A for a DFP that was not providing VCONN in the previous Attached.SRC state.

4.5.3 USB Port Interoperability Behavior

This section describes interoperability behavior between USB Type-C to USB Type-C ports and between USB Type-C to legacy USB ports.

4.5.3.1 USB Type-C Port to USB Type-C Port Interoperability Behaviors

The following sub-sections describe typical port-to-port interoperability behaviors for the various combinations of USB Type-C Source, Sink and DRPs as presented in Table 4-9. In all of the described behaviors, the impact of [USB PD](#)-based swaps (PR_Swap, DR_Swap or VCONN_Swap) are not considered.

The figures in the following sections illustrate the CC1 and CC2 routing after the CC detection process is complete.

4.5.3.1.1 Source to Sink Behavior

Figure 4-21 illustrates the functional model for a Source connected to a Sink. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1.

Figure 4-21 Source to Sink Functional Model

The following describes the behavior when a Source is connected to a Sink.

1. Source and Sink in the unattached state
2. Source transitions from [Unattached.SRC](#) to [Attached.SRC](#) through [AttachWait.SRC](#)
 - Source detects the Sink's pull-down on CC and enters [Attached.SRC](#) through [AttachWait.SRC](#)
 - Source turns on VBUS and VCONN
3. Sink transitions from [Unattached.SNK](#) to [Attached.SNK](#) through [AttachWait.SNK](#).
Sink may skip [AttachWait.SNK](#) if it is USB 2.0 only and does not support accessories.
 - Sink detects VBUS and enters [Attached.SNK](#) through [AttachWait.SNK](#)
4. While the Source and Sink are in the attached state:
 - Source adjusts [Rp](#) as needed to limit the current the Sink may draw
 - Sink detects and monitors [vRd](#) for available current on VBUS
 - Source monitors CC for detach and when detected, enters [Unattached.SRC](#)
 - Sink monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

4.5.3.1.2 Source to DRP Behavior

Figure 4-22 illustrates the functional model for a Source connected to a DRP. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1.

Figure 4-22 Source to DRP Functional Model

The following describes the behavior when a Source is connected to a DRP.

1. Source and DRP in the unattached state
 - DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
2. Source transitions from [Unattached.SRC](#) to [Attached.SRC](#) through [AttachWait.SRC](#)
 - Source detects the DRP's pull-down on CC and enters [AttachWait.SRC](#). After [tCCDebounce](#) it then enters [Attached.SRC](#).
 - Source turns on VBUS and VCONN
3. DRP transitions from [Unattached.SNK](#) to [Attached.SNK](#) through [AttachWait.SNK](#)
 - DRP in [Unattached.SNK](#) detects pull up on CC and enters [AttachWait.SNK](#). After that state persists for [tCCDebounce](#) and it detects VBUS, it enters [Attached.SNK](#).
4. While the Source and DRP are in their respective attached states:
 - Source adjusts [Rp](#) as needed to limit the current the DRP (as Sink) may draw
 - DRP (as Sink) detects and monitors [vRd](#) for available current on VBUS
 - Source monitors CC for detach and when detected, enters [Unattached.SRC](#)
 - DRP (as Sink) monitors VBUS for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

4.5.3.1.3 DRP to Sink Behavior

Figure 4-23 illustrates the functional model for a DRP connected to a Sink. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1.

Figure 4-23 DRP to Sink Functional Model

The following describes the behavior when a DRP is connected to a Sink.

1. DRP and Sink in the unattached state
 - DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DRP transitions from [Unattached.SRC](#) to [AttachWait.SRC](#) to [Attached.SRC](#)
 - DRP in [Unattached.SRC](#) detects one of the CC pull-downs of Sink which is in [Unattached.SNK](#) and DRP enters [AttachWait.SRC](#)
 - DRP in [AttachWait.SRC](#) detects that pull down on CC persists for [tCCDebounce](#). It then enters [Attached.SRC](#) and turns on VBUS and VCONN
3. Sink transitions from [Unattached.SNK](#) to [Attached.SNK](#) through [AttachWait.SNK](#) if required.
 - Sink detects VBUS and enters [Attached.SNK](#)
4. While the DRP and Sink are in their respective attached states:
 - DRP (as Source) adjusts [Rp](#) as needed to limit the current the Sink may draw
 - Sink detects and monitors [vRd](#) for available current on VBUS
 - DRP (as Source) monitors CC for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))
 - Sink monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

4.5.3.1.4 DRP to DRP Behavior

Two behavior descriptions based on the connection state diagrams are provided below. In the first case, the two DRPs accept the resulting Source-to-Sink relationship achieved randomly whereas in the second case the DRP #2 chooses to drive the random result to the opposite result using the [Try.SRC](#) mechanism.

Figure 4-24 illustrates the functional model for a DRP connected to a DRP in the first case described. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1. Port numbers have been arbitrarily assigned in the diagram to assist the reader to understand the process description.

Figure 4-24 DRP to DRP Functional Model – CASE 1

CASE 1: The following describes the behavior when a DRP is connected to another DRP. In this flow, the two DRPs accept the resulting Source-to-Sink relationship achieved randomly.

1. Both DRPs in the unattached state
 - DRP #1 and DRP #2 alternate between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DRP #1 transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - DRP #1 in [Unattached.SRC](#) detects a CC pull down of DRP #2 in [Unattached.SNK](#) and enters [AttachWait.SRC](#)
3. DRP #2 transitions from [Unattached.SNK](#) to [AttachWait.SNK](#)
 - DRP #2 in [Unattached.SNK](#) detects pull up on a CC and enters [AttachWait.SNK](#)
4. DRP #1 transitions from [AttachWait.SRC](#) to [Attached.SRC](#)
 - DRP #1 in [AttachWait.SRC](#) continues to see CC pull down of DRP #2 for [tCCDebounce](#), enters [Attached.SRC](#) and turns on VBUS and VCONN
5. DRP #2 transitions from [AttachWait.SNK](#) to [Attached.SNK](#).
 - DRP #2 after having been in [AttachWait.SNK](#) for [tCCDebounce](#) and having detected VBUS, enters [Attached.SNK](#)
6. While the DRPs are in their respective attached states:
 - DRP #1 (as Source) adjusts R_p as needed to limit the current DRP #2 (as Sink) may draw
 - DRP #2 (as Sink) detects and monitors vRd for available current on VBUS
 - DRP #1 (as Source) monitors CC for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

- DRP #2 (as Sink) monitors VBUS for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

Figure 4-25 illustrates the functional model for a DRP connected to a DRP in the second case described.

Figure 4-25 DRP to DRP Functional Model – CASE 2 & 3

CASE 2: The following describes the behavior when a DRP is connected to another DRP. In this flow, the DRP #2 chooses to drive the random result to the opposite result using the [Try.SRC](#) mechanism.

1. Both DRPs in the unattached state
 - DRP #1 and DRP #2 alternate between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DRP #1 transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - DRP #1 in [Unattached.SRC](#) detects a CC pull down of DRP #2 in [Unattached.SNK](#) and enters [AttachWait.SRC](#)
3. DRP #2 transitions from [Unattached.SNK](#) to [AttachWait.SNK](#)
 - DRP #2 in [Unattached.SNK](#) detects pull up on a CC and enters [AttachWait.SNK](#)
4. DRP #1 transitions from [AttachWait.SRC](#) to [Attached.SRC](#)
 - DRP #1 in [AttachWait.SRC](#) continues to see CC pull down of DRP #2 for [tCCDebounce](#), enters [Attached.SRC](#) and turns on VBUS and VCONN
5. DRP #2 transitions from [AttachWait.SNK](#) to [Try.SRC](#).
 - DRP #2 in [AttachWait.SNK](#) has been in this state for [tCCDebounce](#) and detects VBUS but strongly prefers the Source role, so transitions to [Try.SRC](#)
 - DRP #2 in [Try.SRC](#) asserts a pull-up on CC and waits
6. DRP #1 transitions from [Attached.SRC](#) to [Unattached.SNK](#) to [AttachWait.SNK](#)
 - DRP #1 in [Attached.SRC](#) no longer detects DRP #2's pull-down on CC and transitions to [Unattached.SNK](#).
 - DRP #1 in [Unattached.SNK](#) turns off VBUS and VCONN and applies a pull-down on CC

- DRP #1 in [Unattached.SNK](#) detects pull up on a CC and enters [AttachWait.SNK](#)
- 7. DRP #2 transitions from [Try.SRC](#) to [Attached.SRC](#)
 - DRP #2 in [Try.SRC](#) detects the DRP #1 in [Unattached.SNK](#)'s pull-down on CC and enters [Attached.SRC](#)
 - DRP #2 in [Attached.SRC](#) turns on VBUS and VCONN
- 8. DRP #1 transitions from [AttachWait.SNK](#) to [Attached.SNK](#)
 - DRP #1 in [AttachWait.SNK](#) after [tCCDebounce](#) and detecting VBUS, enters [Attached.SNK](#)
- 9. While the DRPs are in their respective attached states:
 - DRP #2 (as Source) adjusts [Rp](#) as needed to limit the current DRP #1 (as Sink) may draw
 - DRP #1 (as Sink) detects and monitors [vRd](#) for available current on VBUS
 - DRP #2 (as Source) monitors CC for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))
 - DRP #1 (as Sink) monitors VBUS for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

CASE 3: The following describes the behavior when a DRP is connected to another DRP. In this flow, the DRP #1 chooses to drive the random result to the opposite result using the [Try.SNK](#) mechanism.

1. Both DRPs in the unattached state
 - DRP #1 and DRP #2 alternate between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DRP #1 transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - DRP #1 in [Unattached.SRC](#) detects a CC pull down of DRP #2 in [Unattached.SNK](#) and enters [AttachWait.SRC](#)
3. DRP #2 transitions from [Unattached.SNK](#) to [AttachWait.SNK](#)
 - DRP #2 in [Unattached.SNK](#) detects pull up on a CC and enters [AttachWait.SNK](#)
4. DRP #1 transitions from [AttachWait.SRC](#) to [Try.SNK](#)
 - DRP #1 in [AttachWait.SRC](#) has been in this state for [tCCDebounce](#) and detects DRP #2's pull-down on CC but strongly prefers the Sink role, so transitions to [Try.SNK](#)
 - DRP #1 in [Try.SNK](#) asserts a pull down on CC and waits
5. DRP #2 transitions from [AttachWait.SNK](#) to [Unattached.SRC](#) to [AttachWait.SRC](#).
 - DRP #2 in [AttachWait.SNK](#) no longer detects DRP #1's pull up on CC and transitions to [Unattached.SRC](#)
 - DRP #2 in [Unattached.SRC](#) applies a pull up on CC
 - DRP #2 in [Unattached.SRC](#) detects a pull down on a CC pin and enters [AttachWait.SRC](#)
 - DRP #1 detects DRP #2's pull up on CC and remains in [Try.SNK](#)
6. DRP #2 transitions from [AttachWait.SRC](#) to [Attached.SRC](#)

- DRP #2 in [AttachWait.SRC](#) times out ([tCCDebounce](#)) and transitions to [Attached.SRC](#)
 - DRP #2 in [Attached.SRC](#) turns on VBUS and VCONN
7. DRP #1 transitions from [Try.SNK](#) to [Attached.SNK](#)
- DRP #1 in [Try.SNK](#) after detecting VBUS, enters [Attached.SNK](#)
8. While the DRPs are in their respective attached states:
- DRP #2 (as Source) adjusts [Rp](#) as needed to limit the current DRP #1 (as Sink) may draw
 - DRP #1 (as Sink) detects and monitors [vRd](#) for available current on VBUS
 - DRP #2 (as Source) monitors CC for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))
 - DRP #1 (as Sink) monitors VBUS for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

4.5.3.1.5 Source to Source Behavior

Figure 4-26 illustrates the functional model for a Source connected to a Source. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1. Port numbers have been arbitrarily assigned in the diagram to assist the reader to understand the process description.

Figure 4-26 Source to Source Functional Model

The following describes the behavior when a Source is connected to another Source.

1. Both Sources in the unattached state
 - Source #1 fails to detect a Sink's pull-down on CC and remains in [Unattached.SRC](#)
 - Source #2 fails to detect a Sink's pull-down on CC and remains in [Unattached.SRC](#)

4.5.3.1.6 Sink to Sink Behavior

Figure 4-27 illustrates the functional model for a Sink connected to a Sink. The single CC wire that is in a standard cable is only shown in one of the four possible connection routes, CC1 to CC1. Port numbers have been arbitrarily assigned in the diagram to assist the reader to understand the process description.

Figure 4-27 Sink to Sink Functional Model

The following describes the behavior when a Sink is connected to another Sink.

1. Both Sinks in the unattached state

- Sink #1 fails to detect pull up on CC or VBUS supplied by a Source and remains in [Unattached.SNK](#)
- Sink #2 fails to detect pull up on CC or VBUS supplied by a Source and remains in [Unattached.SNK](#)

4.5.3.1.7 DRP to VCONN-Powered USB Device (VPD) Behavior

[Figure 4-28 illustrates the functional model for a DRP connected to a VCONN-Powered USB Device that does not feature charge-through functionality.](#)

Figure 4-28 DRP to VPD Model

The following describes the behavior when a DRP that supports VPDs is connected to a VPD.

1. DRP and VPD in the unattached state
 - DRP alternates between Unattached.SRC and Unattached.SNK
2. DRP transitions from Unattached.SRC to AttachWait.SRC to Attached.SRC
 - DRP in Unattached.SRC detects the CC pull-down of VPD which is in Unattached.SNK and DRP enters AttachWait.SRC
 - DRP in AttachWait.SRC detects that pull-down on CC persists for tCCDebounce. It then enters Attached.SRC and turns on VBUS and VCONN
3. VPD transitions from Unattached.SNK to Attached.SNK through AttachWait.SNK
 - VPD detects VCONN and enters Attached.SNK
4. While DRP and VPD are in their respective attached states, DRP discovers the VPD and removes VBUS
 - DRP (as Source) queries the cable identity via USB PD on SOP'.
 - VPD responds on SOP', advertising that it is a VCONN-Powered USB Device that does not support charge-through
 - DRP (as Source) removes VBUS
 - DRP (as Source) maintains its Rp
5. DRP and VPD for detach
 - DRP (as Source) monitors CC for detach and when detected, enters Unattached.SNK (and resumes toggling between Unattached.SNK and Unattached.SRC)
 - VPD monitors VCONN for detach and when detected, enters Unattached.SNK

4.5.3.2 USB Type-C port to Legacy Port Interoperability Behaviors

The following sub-sections describe port-to-port interoperability behaviors for the various combinations of USB Type-C Source, Sink and DRPs and legacy USB ports.

4.5.3.2.1 Source to Legacy Device Port Behavior

Figure 4-29 illustrates the functional model for a Source connected to a legacy device port. This model is based on having an adapter present as a Sink to the Source. This adapter has a USB Type-C plug on one end plugged into the Source and either a USB Standard-B plug, USB Micro-B plug, USB Mini-B plug, or a USB Standard-A receptacle on the other end.

Figure 4-29 Source to Legacy Device Port Functional Model

The following describes the behavior when a Source is connected to a legacy device adapter that has an Rd to ground so as to mimic the behavior of a Sink.

1. Source in the unattached state
2. Source transitions from Unattached.SRC to Attached.SRC through AttachWait.SRC
 - Source detects the Sink's pull-down on CC and enters AttachWait.SRC. After tCCDebounce, it enters Attached.SRC.
 - Source turns on VBUS and VCONN
3. While the Source is in the attached state:
 - Source monitors CC for detach and when detected, enters Unattached.SRC

4.5.3.2.2 Legacy Host Port to Sink Behavior

Figure 4-30 illustrates the functional model for a legacy host port connected to a Sink. This model is based on having an adapter that presents itself as a Source to the Sink, this adapter is either a USB Standard-A legacy plug or a USB Micro-B legacy receptacle on one end and the USB Type-C plug on the other end plugged into a Sink.

Figure 4-30 Legacy Host Port to Sink Functional Model

The following describes the behavior when a legacy host adapter that has an R_p to VBUS so as to mimic the behavior of a Source that is connected to a Sink. The value of R_p shall indicate an advertisement of Default USB Power (See Table 4-20), even though the cable itself can carry 3 A. This is because the cable has no knowledge of the capabilities of the power source, and any higher current is negotiated via [USB BC 1.2 or by proprietary means.](#)

1. Sink in the unattached state
2. Sink transitions from [Unattached.SNK](#) to [Attached.SNK](#) through [AttachWait.SNK](#) if needed.
 - While in [Unattached.SNK](#), if device is not USB 2.0 only, supports accessories or requires more than default power, it enters [AttachWait.SNK](#) when it detects a pull up on CC and ignores VBUS. Otherwise, it may enter [Attached.SNK](#) directly when VBUS is detected.
 - Sink detects VBUS and enters [Attached.SNK](#)
3. While the Sink is in the attached state:
 - Sink monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

4.5.3.2.3 DRP to Legacy Device Port Behavior

Figure 4-31 illustrates the functional model for a DRP connected to a legacy device port. This model is based on having an adapter present as a Sink (Device) to the DRP. This adapter has a USB Type-C plug on one end plugged into a DRP and either a USB Standard-B plug, USB Micro-B plug, USB Mini-B plug, or a USB Standard-A receptacle on the other end.

Figure 4-31 DRP to Legacy Device Port Functional Model

The following describes the behavior when a DRP is connected to a legacy device adapter that has an [Rd](#) to ground so as to mimic the behavior of a Sink.

[1. DRP in the unattached state](#)

~~[1. DRP in the unattached state](#)~~

- DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
- [2. DRP transitions from \[Unattached.SRC\]\(#\) to \[Attached.SRC\]\(#\)](#)
- DRP in [Unattached.SRC](#) detects the adapter's pull-down on CC and enters [AttachWait.SRC](#)
 - DRP in [AttachWait.SRC](#) times out ([tCCDebounce](#)) and transitions to [Attached.SRC](#)
 - DRP in [Attached.SRC](#) turns on VBUS and VCONN
 - DRP in [AttachWait.SRC](#) may support Try.SNK and if so, may transition through [Try.SNK](#) and [TryWait.SRC](#) prior to entering [Attached.SRC](#)

[3. While the DRP is in the attached state:](#)

~~[3. While the DRP is in the attached state:](#)~~

- DRP monitors CC for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

4.5.3.2.4 Legacy Host Port to DRP Behavior

Figure 4-32 illustrates the functional model for a legacy host port connected to a DRP operating as a Sink. This model is based on having an adapter that presents itself as a Source (Host) to the DRP operating as a Sink, this adapter is either a USB Standard-A legacy plug or a USB Micro-B legacy receptacle on one end and the USB Type-C plug on the other end plugged into a DRP.

Figure 4-32 Legacy Host Port to DRP Functional Model

The following describes the behavior when a legacy host adapter that has an Rp to VBUS so as to mimic the behavior of a Source is connected to a DRP. The value of Rp shall indicate an advertisement of Default USB Power (See Table 4-20), even though the cable itself can carry 3 A. This is because the cable has no knowledge of the capabilities of the power source, and any higher current is negotiated via USB BC 1.2 or by proprietary means.

4.1. DRP in the unattached state

1. DRP in the unattached state

- DRP alternates between Unattached.SRC and Unattached.SNK
2. DRP transitions from Unattached.SNK to AttachWait.SNK to Attached.SNK
- DRP in Unattached.SNK detects pull up on CC and enters AttachWait.SNK.
 - DRP in AttachWait.SNK detects VBUS and enters Attached.SNK
 - DRP in AttachWait.SNK may support Try.SRC and if so, may transition through Try.SRC and TryWait.SNK prior to entering Attached.SNK

5.1. While the DRP is in the attached state:

3. While the DRP is in the attached state:

- DRP monitors VBUS for detach and when detected, enters Unattached.SNK (and resumes toggling between Unattached.SNK and Unattached.SRC)

4.6 Power

Power delivery over the USB Type-C connector takes advantage of the existing USB methods as defined by: the USB 2.0 and USB 3.1 specifications, the USB BC 1.2 specification and the USB Power Delivery specification. The USB Type-C Current mechanism allows the Source to offer more current than defined by the USB BC 1.2 specification. A USB power source shall not provide more than 20 V nominal on VBUS. USB PD power sources that deliver power over

a USB Type-C connector shall follow the power rules as defined in Section 10 of the [USB Power Delivery](#) specification.

All USB Type-C-based devices shall support [USB Type-C Current](#) and may support other USB-defined methods for power. The following order of precedence of power negotiation shall be followed: [USB BC 1.2](#) supersedes the [USB 2.0](#) and [USB 3.1](#) specifications, [USB Type-C Current](#) at 1.5 A and 3.0 A supersedes [USB BC 1.2](#), and [USB Power Delivery](#) supersedes [USB Type-C Current](#). Table 4-17 summarizes this order of precedence of power source usage.

Table 4-17 Precedence of power source usage

Precedence	Mode of Operation		Nominal Voltage	Maximum Current
Highest ↓ Lowest	USB PD		Configurable	5 A
	USB Type-C Current @ 3.0 A		5 V	3.0 A
	USB Type-C Current @ 1.5 A		5 V	1.5 A
	USB BC 1.2		5 V	Up to 1.5 A ¹
	Default USB Power	USB 3.1	5 V	See USB 3.1
		USB 2.0	5 V	See USB 2.0

Notes:

1. [USB BC 1.2](#) permits a power provider to be designed to support a level of power between 0.5 A and 1.5 A. If the [USB BC 1.2](#) power provider does not support 1.5 A, then it is required to follow power droop requirements. A [USB BC 1.2](#) power consumer may consume up to 1.5 A provided that the voltage does not drop below 2 V, which may occur at any level of power above 0.5 A.

For example, once the PD mode (e.g. a power contract has been negotiated) has been entered, the device shall abide by that power contract ignoring any other previously made or offered by the [USB Type-C Current](#), [USB BC 1.2](#) or [USB 2.0](#) and [USB 3.1](#) specifications. When the PD mode is exited, the device shall fallback in order to the [USB Type-C Current](#), [USB BC 1.2](#) or [USB 2.0](#) and [USB 3.1](#) specification power levels.

All USB Type-C ports shall tolerate being connected to USB power source supplying default USB power, e.g. a host being connected to a legacy USB charger that always supplies VBUS.

4.6.1 Power Requirements during USB Suspend

USB Type-C implementations with [USB Type-C Current](#), [USB PD](#) and VCONN, along with active cables, requires the need to expand the traditional USB suspend definition.

4.6.1.1 VBUS Requirements during USB Suspend

The [USB 2.0](#) and [USB 3.1](#) specifications define the amount of current a Sink is allowed to consume during suspend.

USB suspend power rules shall apply when the [USB Type-C Current](#) is at the Default USB Power level or when [USB PD](#) is being used and the Suspend bit is set appropriately.

When [USB Type-C Current](#) is set at 1.5 A or 3.0 A, the Sink is allowed to continue to draw current from VBUS during USB suspend. During USB suspend, the Sink's requirement to track and meet the [USB Type-C Current](#) advertisement remains in force (See Section 4.5.2.3).

USB PD provides a method for the Source to communicate to the Sink whether or not the Sink has to follow the USB power rules for suspend.

4.6.1.2 VCONN Requirements during USB Suspend

If the Source supplies VBUS power during USB suspend, it shall also supply VCONN and meet the requirements defined in Table 4-5 at least 7.5 mA to VCONN.

Electronically Marked Cables~~Electronically marked cables~~ shall ~~draw no more than 7.5 mA from VCONN~~ meet the requirements in Table 4-6 during USB suspend.

VCONN powered accessories shall meet the requirements defined in Table 4-7 during USB suspend.

4.6.2 VBUS Power Provided Over a USB Type-C Cable

The minimum requirement for VBUS power supplied over the USB Type-C cable assembly matches the existing requirement for VBUS supplied over existing legacy USB cable assemblies. USB Power Delivery is an optional capability that is intended to work over unmodified USB Type-C to USB Type-C cables, therefore any USB Type-C cable assembly that incorporates electrical components or electronics shall ensure that it tolerate, or be protected from, a VBUS voltage of 21 V.

4.6.2.1 USB Type-C Current

Default USB voltage and current are defined by the USB 2.0 and USB 3.1 specifications. All USB Type-C Current advertisements are at the USB VBUS voltage defined by these specifications.

The USB Type-C Current feature provides the following extensions:

- Higher current than defined by the USB 2.0, the USB 3.1 or the BC 1.2 specifications
- Allows the power source to manage the current it provides

The USB Type-C connector uses CC pins for configuration including an ability for a Source to advertise to its port partner (Sink) the amount of current it can supply:

- Default values when configured for high-power operation as defined by the USB Specification (500 mA for USB 2.0 ports, 900 mA for USB 3.1 ports)
- 1.5 A
- 3.0 A

The relationship of USB Type-C Current and the equivalent USB PD Power (PDP) value is shown in Table 4-18.

Table 4-18 USB Type-C Current Advertisement and PDP Labeling

USB Type-C Current		PDP Label
Default	500 mA (USB 2.0)	2.5 W
	900 mA (USB 3.1)	4.5 W
1.5 A		7.5 W
3.0 A		15 W

A Sink that takes advantage of the additional current offered (e.g., 1.5 A or 3.0 A) shall monitor the CC pins and shall adjust its current consumption within [tSinkAdj](#) to remain within the value advertised by the Source. While a [USB PD](#) contract is in place, a Sink is not required to monitor USB Type-C current advertisements and shall not respond to USB Type-C current advertisements.

The Source shall supply VBUS to the Sink within [tVBUSOn](#). VBUS shall be in the specified voltage range at the advertised current.

A Source (port supplying VBUS) shall protect itself from a Sink that draws current in excess of the port's USB Type-C Current advertisement.

The Source adjusts [Rp](#) (or current source) to advertise which of the three current levels it supports. See Table 4-20 for the termination requirements for the Source to advertise currents.

The value of [Rp](#) establishes a voltage ([vRd](#)) on CC that is used by the Sink to determine the maximum current it may draw.

Table 4-31 defines the CC voltage range observed by the Sink that only support default USB current.

If the Sink wants to consume more than the default USB current, it shall track [vRd](#) to determine the maximum current it may draw. See Table 4-32.

Figure 4-33 and Figure 4-34 illustrate where the Sink monitors CC for [vRd](#) to detect if the host advertises more than the default USB current.

Figure 4-33 Sink Monitoring for Current in Pull-Up/Pull-Down CC Model

Figure 4-34 Sink Monitoring for Current in Current Source/Pull-Down CC Model

4.6.2.2 USB Battery Charging 1.2

[USB Battery Charging Specification, Revision 1.2](#) defines a method that uses the USB 2.0 D+ and D- pins to advertise VBUS can supply up to 1.5 A. Support for [USB BC 1.2](#) charging is optional.

A USB Type-C-based-charger port that implements [BC 1.2](#) is capable of supplying at least 1.5 A shall advertise [USB Type-C Current](#) at the 1.5 A level [within tVBUSON of entering the Attached.SRC state](#), otherwise the charger port shall advertise [USB Type-C Current](#) at the Default USB Power level. A USB Type-C-based port that implements [BC 1.2](#) charger that also supports [USB Type-C Current](#) at 3.0 A may advertise [USB Type-C Current](#) at 3.0 A.

If a Sink that supports [BC 1.2](#) detection, detects Rp at the Default USB Power level and does not discover a [BC 1.2](#)-compliant Source, then it shall limit its maximum current consumption to the standard USB levels based on Table 4-17. This will ensure maximum current limits are not exceeded when connected to a Source which does not support [BC 1.2](#).

4.6.2.3 Proprietary Power Source

A proprietary power source (i.e., battery charger) with a USB Type-C captive cable or a USB Type-C receptacle that is capable of supplying at least 1.5 A and less than 3.0 A shall advertise at least at the 1.5 A level.

A proprietary power source with a USB Type-C captive cable or a USB Type-C receptacle that is capable of supplying at least 3.0 A shall advertise at least at the 3.0 A level.

This section has been deprecated. Devices with USB Type-C connectors shall only employ signaling methods defined in USB specifications to negotiate power.

4.6.2.4 USB Power Delivery

[USB Power Delivery](#) is a feature on the USB Type-C connector. When [USB PD](#) is implemented, [USB PD](#) Bi-phase Mark Coded (BMC) carried on the CC wire shall be used for [USB PD](#) communications between USB Type-C ports.

At attach, VBUS shall be operationally stable prior to initiating [USB PD](#) communications.

Figure 4-35 illustrates how the [USB PD](#) BMC signaling is carried over the USB Type-C cable's CC wire.

Figure 4-35 USB PD over CC Pins

Figure 4-36 illustrates [USB PD](#) BMC signaling as seen on CC from both the perspective of the Source and Sink. The breaks in the signaling are intended to represent the passage of time.

Figure 4-36 USB PD BMC Signaling over CC

When not in an Explicit Contract, USB PD Sources that are, based on their PDP, capable of supplying:

- 5 V at 3 A or greater shall advertise USB Type-C Current at the 3 A level
- 5 V at 1.5A or greater but less than 3 A shall advertise USB Type-C Current at the 1.5 A level
- 5 V at less than 1.5A shall advertise USB Type-C Current at the Default USB Power level

within tVBUSON of entering the Attached.SRC state. For Multi-Port Shared Capacity Chargers, a USB PD Source capable of supplying 5 V at 3A or greater may initially offer USB Type-C Current at the 1.5 A level and subsequently increase the offer after attach (see Section 4.8.6.2). During USB Suspend a USB PD Source may set its Rp value to default to indicate that the Sink shall only draw USB suspend current as defined in Section 4.6.1.1.

While ~~an~~ a USB PD Explicit Contract is in place, ~~the~~ a Source compliant with USB PD Revision 2 shall advertise a USB Type-C Current of either 1.5 A or 3.0 A. The USB PD Revision 2 Source upon entry into an Explicit Contract shall advertise an Rp value of 1.5 A or 3.0 A after it receives the GoodCRC in response to the first PS_RDY Message.

While a USB PD Explicit Contract is in place, a Source compliant with USB PD Revision 3 shall set the Rp value according to the collision avoidance scheme defined in Section 5.7 of the USB PD Revision 3 specification. The USB PD Revision 3 Source upon entry into an Explicit Contract shall advertise an Rp value consistent with the USB PD and before it sends any other messages. Revision 3 collision avoidance scheme.

Refer to Section 1.6 of the [USB Power Delivery](#) specification for a definition of an Explicit Contract.

4.7 USB Hubs

USB hubs are defined by the [USB 2.0](#) and [USB 3.1](#) specifications. USB hubs implemented with one or more USB Type-C connectors shall comply with the [USB 2.0 specification or both the USB 2.0 and USB 3.1 specifications as relevant to a USB Type-C implementation](#). All the downstream facing USB Type-C ports on a USB hub should support the same functionality or shall be clearly marked as to the functionality supported.

USB hubs shall have an upstream facing port (to connect to a host or hub higher in the USB tree) that may be a Sourcing Device (See Section 4.8.4). The hub shall clearly identify to the user its upstream facing port. This may be accomplished by physical isolation, labeling or a combination of both.

USB hub's downstream facing ports shall not have Dual-Role-Data (DRD) capabilities. However, these ports may have Dual-Role-Power (DRP) capabilities.

CC pins are used for port-to-port connections and shall be supported on all USB Type-C connections on the hub.

USB hub ports shall not implement or pass-through Alternate or Accessory Modes. SBU pins shall not be connected ([zSBUTermination](#)) on any USB hub port.

The USB hub's DFPs shall support power source requirements for a Source. See Section 4.8.1.

4.8 Chargers

4.8 Power Sourcing and Charging

This section defines requirements and recommendations related to using USB Type-C ports for delivering power.

The following lists the most applicable subsections by USB Type-C ports on:

- Host systems: 4.8.1 and 4.8.5. Note: 4.8.6 is not intended for host systems.
- Devices that can supply power: 4.8.4.
- Hubs:
 - Traditional hubs – Refer to USB 2.0/USB 3.1 base specifications and 4.8.1 as applicable if USB BC 1.2 is supported.
 - Hubs that can supply power beyond the base specs – 4.8.1, 4.8.4, 4.8.5 and 4.8.6.
- Dedicated chargers:
 - Single-port chargers – 4.8.1.
 - Multi-port chargers – 4.8.1 and 4.8.6.

4.8.1 DFP as a Power Source

Sources (e.g. battery chargers, hub downstream ports and hosts) may all be used for battery charging. When a charger is implemented with a USB Type-C receptacle or a USB Type-C captive cable, it shall follow all the applicable requirements.

- A Source shall expose its power capabilities using the [USB Type-C Current](#) method and it may additionally support other USB-standard methods ([USB BC 1.2](#) or [USB-PD](#)).
- ~~A Source may also expose its identity and/or power capabilities using a proprietary (e.g. non-USB standard) method. A proprietary method may source up to 5 A if it has a captive cable capable of carrying that level of current. See Section for additional requirements.~~
- A Source advertising its current capability using [USB BC 1.2](#) shall meet the requirements in Section 4.6.2.2 regarding USB Type-C Current advertisement.

- A Source that has negotiated a [USB-PD](#) contract shall meet the requirements in Section 4.6.2.4 regarding [USB Type-C Current](#) advertisement.
- If a Source is capable of supplying a voltage greater than default VBUS, it shall fully conform to the [USB-PD](#) specification, and shall negotiate its power contracts using only [USB-PD](#).
- If a Source is capable of reversing source and sink power roles, it shall fully conform to the [USB-PD](#) specification, and shall negotiate its power contracts using only [USB-PD](#).
- If a Source is capable of supplying a current greater than 3.0 A, it shall use the [USB-PD](#) Discover Identity to determine the current carrying capacity of the cable.

4.8.1.1 USB-based Chargers with USB Type-C Receptacles

- A USB-based charger with a USB Type-C receptacle (Source) shall only apply power to VBUS when it detects a Sink is attached and shall remove power from VBUS when it detects the Sink is detached ([vOPEN](#)).
- A USB-based charger with a USB Type-C receptacle shall not advertise current exceeding 3.0 A except when it uses the [USB-PD](#) Discover Identity mechanism to determine the cable's actual current carrying capability and then it shall limit the advertised current accordingly.
- [A USB-based charger with a USB Type-C receptacle \(Source\) which is not capable of data communication shall advertise USB Type-C Current of at least 1.5 A within tVBusON of entering the Attached.SRC state and shall short D+ and D- together with a resistance less than 200 ohms. This will ensure backwards compatibility with legacy sinks which may use BC1.2 for charger detection.](#)

4.8.1.2 USB-based Chargers with USB Type-C Captive Cables

- A USB-based charger with a USB Type-C captive cable that supports USB PD shall only apply power to VBUS when it detects a Sink is attached and shall remove power from VBUS when it detects the Sink is detached ([vOPEN](#)).
- A USB-based charger with a USB Type-C captive cable that does not support USB PD may supply VBUS at any time. It is recommended that such a charger only apply power to VBUS when it detects a Sink is present and remove power from VBUS when it detects the Sink is not present ([vOPEN](#)).
- A USB-based charger with a USB Type-C captive cable shall limit its current advertisement so as not to exceed the current capability of the cable (up to 5 A).
- [A USB-based charger with a USB Type-C captive cable which is not capable of data communication shall advertise USB Type-C Current of at least 1.5 A. It is recommended that such a charger short D+ and D- together with a resistance less than 200 ohms.](#)
- The voltage as measured at the plug of a USB-based charger with a USB Type-C captive cable may be up to $0.75 \times I / 3$ V ($0 < I \leq 3$ A), or $0.75 \times I / 5$ V ($0 < I \leq 5$ A) lower than the standard tolerance range for the chosen voltage, where I is the actual current being drawn.
 - A USB-based charger that advertises [USB Type-C Current](#) shall output a voltage in the range of 4.75 V – 5.5 V when no current is being drawn and between 4.0 V – 5.5 V at 3 A. The output voltage as a function of load up to the advertised [USB Type-C Current](#) (default, 1.5 A and 3 A) shall remain within the cross-hatched area shown in Figure 4-37.

Figure 4-37 USB Type-C Cable's Output as a Function of Load for Non-PD-based USB Type-C Charging

- A USB PD-based charger that has negotiated a voltage V at ≤ 3 A shall output a voltage in the range of V_{max} ($V + 5\%$) and V_{min} ($V - 5\%$) when no current is being drawn and V_{max} and $V_{min} - 0.75$ V at 3 A. Under all loads, the output voltage shall remain within the cross-hatched area shown in Figure 4-38.

Figure 4-38 0 – 3 A USB PD-based Charger USB Type-C Cable's Output as a Function of Load

- A USB PD-based charger that has negotiated a voltage V at between 3 A and 5 A shall output a voltage in the range of V_{max} ($V + 5\%$) and V_{min} ($V - 5\%$) when no current is being drawn and V_{max} and $V_{min} - 0.75$ V at 5 A. Under all loads, the output voltage shall remain within the cross hatched area shown in Figure 4-39.

Figure 4-39 3 – 5 A USB PD-based Charger USB Type-C Cable’s Output as a Function of Load

- Note: The maximum allowable cable IR drop for ground is 250 mV (see Section 4.4.1). This is to ensure the signal integrity of the CC wire when used for connection detection and [USB PD](#) BMC signaling.

4.8.2 Non-USB Charging Methods

~~A charger~~~~A product (Source and/or Sink)~~ with a USB Type-C connector ~~may~~ shall only employ ~~additional proprietary charging~~~~signaling~~ methods ~~defined in USB specifications~~ to ~~sourcenegotiate~~ power ~~beyond what is allowed by the USB defined methods~~. When implemented, ~~proprietary methods must meet the following requirements:~~

- ~~The method shall only be used to establish identity and/or a current level at default V_{BUS} voltage in a manner not defined by the USB methods~~
- ~~The method shall only define the current level and shall not change the voltage delivered on V_{BUS} over its~~
 - ~~The method shall not alter the Source's role to supply V_{BUS} or the Sink's role to consume V_{BUS}~~
 - ~~See Section for additional requirements regarding USB Type-C Current advertisement.~~

~~A product with a USB Type-C connector that consumes power may support proprietary charging methods, these products shall not support methods that redefine V_{BUS} voltage beyond what is defined by the and specifications-(s).~~

4.8.3 Sinking Host

A Sinking Host is a special sub-class of a DRP that is capable of consuming power, but is not capable of acting as a USB device. For example a hub's DFP or a notebook's DFP that operates as a host but not as a device.

The Sinking Host shall follow the rules for a DRP (See Section 4.5.1.4 and Figure 4-15). The Sinking DFP shall support [USB PD](#) and shall support the DR_Swap command in order to get the Sink into the UFP data role.

4.8.4 Sourcing Device

A Sourcing Device is a special sub-class of a DRP that is capable of supplying power, but is not capable of acting as a USB host. For example a hub's UFP or a monitor's UFP that operates as a device but not as a host.

The Sourcing Device shall follow the rules for a DRP (See Section 4.5.1.4 and Figure 4-15). It shall also follow the requirements for the Source as Power Source (See Section 4.8.1). The Sourcing Device shall support [USB PD](#) and shall support the DR_Swap command in order to enable the Source to assume the UFP data role.

4.8.5 Charging a System with a Dead Battery

A system that supports being charged by USB whose battery is dead shall apply [Rd](#) to both CC1 and CC2 and follow all Sink rules. When it is connected to a Source, DRP or Sourcing Device, the system will receive the default VBUS. It may use any allowed method to increase the amount of power it can use to charge its battery.

Circuitry to present [Rd](#) in a dead battery case only needs to guarantee the voltage on CC is pulled within the same range as the voltage clamp implementation of [Rd](#) in order for a Source to recognize the Sink and provide VBUS. For example, a 20% resistor of value [Rd](#) in series with a FET with $V_{GTH}(\text{max}) < V_{CLAMP}(\text{max})$ with the gate weakly pulled to CC would guarantee detection and be removable upon power up.

When the system with a dead battery has sufficient charge, it may use the [USB PD](#) DR_Swap message to become the DFP.

4.8.6 USB Type-C Multi-Port Chargers

A USB Type-C Multi-Port Charger is a product that exposes multiple USB Type-C Source ports for the sole purpose of charging multiple connected devices. A compliant USB Type-C charger may offer on each of its ports a mix of power options as defined in Section 4.6.

Multi-Port Chargers will generally fall into two categories as defined by the following.

1. Assured Capacity Chargers: a multi-port charger where the sum of the maximum capabilities of all of the exposed ports, as indicated to the user, is equal to the total power delivery capacity of the charger.
2. Shared Capacity Chargers: a multi-port charger where the sum of the maximum capabilities of all of the exposed ports, as indicated to the user, is less than the total power delivery capacity of the charger.

A Multi-Port Charger may offer in a single product separate visually identifiable groupings of charging ports. In this case, each group can independently offer either one of the two charging categories, either an Assured Capacity Charger or a Shared Capacity Charger.

This section defines the requirements and provides guidelines for the operation and behavior of a USB Type-C Multi-Port Charger.

4.8.6.1 General Requirements

Individual source ports shall always comply with power negotiation and rules set forth by the USB Type-C and USB Power Delivery specifications, adjusted as needed when available resources change as other ports take more or less power.

The minimum capability of all individual USB Type-C ports of a USB Type-C Multi-Port Charger shall be 5V @ 1.5 A independent of how many of the other ports are in use.

When a USB Type-C Charger includes charging ports that are based on USB Standard-A receptacles, the following requirements shall be met.

- The USB Standard-A ports shall be implemented as an independent group, i.e. USB Standard-A ports shall not be included in a group of USB Type-C ports behaving as a Shared Capacity Charger.
- The minimum capability of all USB Standard-A ports shall be 5V @ 500 mA independent of how many of the other ports are in use.

4.8.6.2 Multi-Port Charger Behaviors

Each Source port of Assured Capacity Chargers shall, by design, behave independently and be unaffected by the status and loading of the other ports. An exception to this behavior is allowed if the charger has to take any action necessary to meet an overall product operational safety requirement due to unexpected behavior on any port.

For Shared Capacity Chargers, the following behavioral rules shall apply:

- Each of the exposed Source Ports shall have the same power capabilities. Each port of the charger shall be capable of the same maximum capability, minimum capability, and be able to draw from the shared power equally. Each port should start by offering the minimum capability for the port and increase the offering to the Sink upon a connection. For example, if the maximum capability of a USB Type-C only Source port is 3 A, then all of the exposed Source ports will be able to offer 3 A. Each port should start by offering less than the max (such as 1.5 A) and then increase the offering to 3 A after an attach. This will happen for each port as it is connected until the unused shared capacity is exhausted, at which point no other ports would increase to 3 A offering. A sink, in this example, would see a starting advertisement of [USB Type-C Current](#) @ 1.5 A at attach and would then see the [USB Type-C Current](#) advertisement increase to 3 A. As another example, if the maximum capability of a USB Type-C Source port is to offer [USB PD](#) with a PDP of 35 W, then all of the exposed Source ports will also support [USB PD](#) 35 W. Each port should start by offering something less on initial connection, like 15 W, and then increase the offering with new Source Capabilities when it determines the Sink would like more power. If the Sink is not offered the power it requires, it will send a request with the Capability Mismatch bit set to indicate to the source it wants more power. This will happen for each port as it is connected until the unused shared capacity is exhausted, at which point no other ports would increase the power offering.
- As Source ports are connected, the remaining Source ports shall each have the same power capabilities. The maximum capability may be less than the previously connected ports due to less unused capacity of the total power delivery capacity of the charger. For example, if the total power delivery capacity of a USB Type-C two-port charger is 60 W with a port PDP of 35 W and the first connected Source port has established a 35 W power contract with its connected Sink, then the second Source port will be able to offer a PDP of 25 W.
- When establishing the remaining available capacity, a charger that supports policy-based power rebalancing may include the power that can be reclaimed from ports already in use:
 - by adjusting advertised source capabilities equivalent with a reduced PDP to one or more ports that are already in use; or
 - by issuing a [USB PD GotoMin](#) command to one or more ports already in use.

Policy-based power rebalancing should consider providing good user experience and preserving nominal USB functionality on impacted devices. Fixed rebalancing algorithms that do not factor in overall USB system policy may not be appropriate for power rebalancing implementations.

4.8.6.3 Multi-Port Charger Port Labeling

Multi-port chargers shall have OEM-designed port labeling consistent with the following rules.

- For Assured Capacity Chargers, each exposed Source port shall be labeled to indicate the PDP of the port. In this case, the user will be able to expect that each of the labeled ports will be able to meet power contracts consistent with the labeling independent of how many of the Source ports are in use.
- For Shared Capacity Chargers, each Source port shall be labeled to indicate the same PDP. Additionally, the charger shall have a label that, with a minimum of equal visual prominence, indicates the total power delivery capacity being shared across all of the ports identified as a group.

A Multi-Port Charger that offers in a single product separate groupings of charging ports, each grouping shall be clearly identified as a separate grouping and each grouping shall be individually labeled consistent with that group's behavior model, either as an Assured Capacity Charger or a Shared Capacity Charger.

Refer to the USB Implementers Forum (USB-IF) for USB Type-C Chargers certification along with further labeling guidelines.

4.8.6.4 Multi-Port Charger that include USB Data Hub Functionality

Multi-Port chargers that also incorporate USB data hub capabilities shall meet the same requirements as standalone chargers. These charging-capable hubs shall be self-powered and shall fully operate as a charger independent of the state of the USB data bus connections.

For hub-based Multi-Port Chargers that offer power to the upstream-facing port (to the host), this port may either behave as an Assured Capacity Charging port (e.g. be a dedicated charging port) or as a Shared Capacity Charging port (e.g. sharing capacity with downstream-facing ports). In either case, it should be clearly labeled consistent with its designed behavior, including identifying it as part of a group if it is sharing capacity with other ports.

When the upstream-facing port is sharing capacity with the downstream-facing ports, the PDP of the upstream-facing port can differ from the downstream-facing ports.

4.9 Electronically Marked Cables

All USB Full-Featured Type-C cables shall be electronically marked. USB 2.0 Type-C cables may be electronically marked. An eMarker is element in an Electronically Marked Cable that returns information about the cable in response to a USB PD Discover Identity command.

Electronically marked cables shall support USB Power Delivery Structured VDM Discover Identity command directed to SOP'-(the eMarker). This provides a method to determine the characteristics of the cable, e.g. its current carrying capability, its performance, vendor identification, etc. This may be referred to as the USB Type-C Cable ID function.

Prior to an explicit USB PD contract, a Sourcing Device is allowed to use SOP' to discover the cable's identity. After an explicit USB PD contract has been negotiated, only the Source shall communicate with SOP' and SOP" (see Section 5.2.2).

An electronically marked cable incorporates electronics that require VCONN, although VBUS or another source may be used. Electronically marked Passive cables that do not incorporate data bus signal conditioning circuits include an eMarker shall follow the Cable State Machine

~~defined in Section 4.5.2.4 and Figure 4-19 consume no more than 70 mW from VCONN. During USB suspend, .~~

Electronically marked cables ~~are generally powered from VCONN, although VBUS or another source may be used. Cables that include an eMarker shall meet the maximum power defined in Table 4-6.~~

~~Refer to Table 4-5 for the requirements of a Source to supply VCONN. When VCONN is not present, a powered cable shall not interfere with normal CC operation including Sink detection, current advertisement and USB PD draw more than 7.5 mA from VCONN, see Section - operation.~~

Figure 4-40 illustrates a typical electronically marked cable. The isolation elements (Iso) shall prevent VCONN from traversing end-to-end through the cable. R_a is required in the cable to allow the Source to determine that VCONN is needed.

Figure 4-40 Electronically Marked Cable with VCONN connected through the cable

Figure 4-41 illustrates an electronically marked cable where the VCONN wire does not extend through the cable, therefore an SOP' (eMarker) element is required at each end of the cable. In this case, no isolation elements are needed.

Figure 4-41 Electronically Marked Cable with SOP' at both ends

For cables that only respond to SOP', the location of the responder is not relevant.

4.9.1 Parameter Values

Table 4-19 provides the power on timing requirements for the eMarker SOP' and SOP" to be ready to communicate.

Table 4-19 SOP' and SOP" Timing

	<u>Maximum</u>	<u>Description</u>
<u>tVCONNStable</u>	<u>50 ms</u>	<u>The time between the application of VCONN until SOP' and SOP" shall be ready for communication.</u>

4.9.2 Active Cables

An active cable is an electronically marked cable that incorporates data bus signal conditioning circuits, for example to allow for implementing longer cables. Active cables with data bus signal conditioning in both plugs shall not draw more than 1 W from VCONN, see Section implement SOP' and may implement SOP". Active cables shall meet the power requirements defined in Table 4-6.

Active cables may support either one SSTX/SSRX pair or two SSTX/SSRX pairs. The eMarker in the cable shall identify the number of SSTX/SSRX lanes supported. Active cables may or may not require configuration management. Requirements for active cables that require Active cable configuration management are provided in Section 5.2.

Refer to Section for the requirements of a Source to supply VCONN. When VCONN is not present, a powered cable shall not interfere with normal CC operation including Sink detection, current advertisement and operation.

4.10 VCONN-Powered Accessories (VPAs) and VCONN-Powered USB Devices (VPDs)

4.10 VCONN-Powered Accessories

A and VCONN-Powered accessory is a USB Devices are both direct-attach Sinks that implements an (See Section) and can operate with just VCONN.

The VCONN-powered accessory exposes Both expose a maximum impedance to ground of Ra on the VCONN pin and Rd on the CC pin.

The removal of VCONN when VBUS is not present shall be treated as a detach event.

4.10.1 VCONN-Powered Accessories (VPAs)

A VCONN-Powered Accessory implements an Alternate Mode (See Section 5.1).

VCONN-Powered Accessories shall comply with Table 4-7.

When operating in the UPPSink role and when VBUS is not present, VCONN-Powered Accessories shall treat the application of VCONN as an attach signal, and shall respond to USB Power Delivery messages.

When powered by only VCONN, a VCONN-Powered Accessory shall negotiate an Alternate Mode. If it fails to negotiate an Alternate Mode within tAMETimeout, its port partner removes VCONN.

VCONN-powered accessories shall be able to operate over a range of 2.7 V to 5.5 V on VCONN.

~~The removal of VCONN when VBUS is not present shall be treated as a detach event.~~ When VBUS is supplied, a VCONN-Powered Accessory is subject to all of the requirements for Alternate Mode~~Alternate Modes~~, including presenting a USB Billboard Device Class interface if negotiation for an Alternate Mode~~Alternate Mode~~ fails.

~~Should a VCONN-Powered Accessory wish to provide charge-through functionality, it must do so by negotiating voltage and current independently on both the Host and charge-through ports, and possibly re-regulating the voltage from the Source before passing it through to the Sink. The Sink is able to take the full current that is advertised to it by the VCONN-Powered Accessory.~~

4.10.2 VCONN-Powered USB Devices (VPDs)

A VCONN-Powered USB Device shall implement a USB UFP endpoint.

VCONN-Powered USB Devices shall comply with Table 4-8.

~~When VBUS is not present, VCONN-Powered USB Devices shall treat the application of VCONN as an attach signal.~~

A VCONN-powered USB Device shall only respond to USB PD messaging on SOP'.

~~When VBUS is supplied, the VCONN-Powered USB Device shall behave like a normal UFP Sink, but still only respond to USB PD messaging on SOP'. If VBUS is subsequently removed while VCONN remains applied, the VCONN-Powered USB Device shall remain connected, and use VCONN as the sole detach signal.~~

~~Since VCONN-Powered USB Devices do not respond to USB PD on SOP, they cannot enter traditional alternate modes.~~

4.11 Parameter Values

4.11.1 Termination Parameters

Table 4-20 provides the values that shall be used for the Source's R_p or current source. Other pull-up voltages shall be allowed if they remain less than 5.5 V and fall within the correct voltage ranges on the Sink side – see Table 4-28, Table 4-29 and Table 4-30. Note: when two Sources are connected together, they may use different termination methods which could result in unexpected current flow.

Table 4-20 Source CC Termination (R_p) Requirements

Source Advertisement	Current Source to 1.7 – 5.5 V	Resistor pull-up to 4.75 – 5.5 V	Resistor pull-up to 3.3 V ± 5%
Default USB Power	80 µA ± 20%	56 kΩ ± 20% (Note 1)	36 kΩ ± 20%
1.5 A @ 5 V	180 µA ± 8%	22 kΩ ± 5%	12 kΩ ± 5%
3.0 A @ 5 V	330 µA ± 8%	10 kΩ ± 5%	4.7 kΩ ± 5%

Notes:

1. For R_p when implemented in the USB Type-C plug on a USB Type-C to USB 3.1 Standard-A Cable Assembly, a USB Type-C to USB 2.0 Standard-A Cable Assembly, a USB Type-C to USB 2.0 Micro-B Receptacle Adapter Assembly or a USB Type-C captive cable connected to a USB host, a value of 56 kΩ ± 5% shall be used, in order to provide tolerance to IR drop on VBUS and GND in the cable assembly.

The Sink may find it convenient to implement [Rd](#) in multiple ways simultaneously (a wide range [Rd](#) when unpowered and a trimmed [Rd](#) when powered). Transitions between [Rd](#) implementations that do not exceed [tCCDebounce](#) shall not be interpreted as exceeding the wider [Rd](#) range. Table 4-21 provides the methods and values that shall be used for the Sink's [Rd](#) implementation.

Table 4-21 Sink CC Termination (Rd) Requirements

Rd Implementation	Nominal value	Can detect power capability?	Max voltage on pin
± 20% voltage clamp¹	1.1 V	No	1.32 V
± 20% resistor to GND	5.1 kΩ	No	2.18 V
± 10% resistor to GND	5.1 kΩ	Yes	2.04 V

Note:

1. The clamp implementation inhibits [USB PD](#) communication although the system can start with the clamp and transition to the resistor once it is able to do [USB PD](#).

Table 4-22 provides the impedance value to ground on VCONN in powered cables.

Table 4-22 Powered Cable Termination Requirements

	Minimum Impedance	Maximum Impedance
Ra	800 Ω ¹	1.2 kΩ

Note:

1. The minimum impedance may be less when powering active circuitry.

Table 4-23 provides the minimum impedance value to ground on CC for a self-powered device (Sink) or a device that supports the Disabled state or [ErrorRecovery](#)~~ErrorRecovery~~ state to be undetected by a Source.

Table 4-23 Sink CC Termination Requirements

	Minimum Impedance to GND
zOPEN	126 kΩ

Table 4-24 provides the impedance value for an SBU to appear open.

Table 4-24 SBU Termination Requirements

	Termination	Notes
zSBUTermination	≥ 950 kΩ	Functional equivalent to an open circuit

4.11.2 Timing Parameters

Table 4-25 provides the timing values that shall be met for delivering power over VBUS and VCONN.

Table 4-25 VBUS and VCONN Timing Parameters

	Minimum	Maximum	Description
tVBUSON	0 ms	275 ms	From entry to Attached.SRC until VBUS reaches the minimum vSafe5V threshold as measured at the source's receptacle.
tVBUSSOFF	0 ms	650 ms	From the time the Sink is detached until the Source removes VBUS and reaches vSafe0V (See USB PD).
tVCONNON	Note 1	2 ms	From the time the Source supplied VBUS in the Attached.SRC state. Measured from vSafe5V to the minimum VCONN voltage (see Table 4-5)
tVCONNON-PA	0 ms	100 ms	From the time a Sink with accessory support enters the PoweredAccessory state until the Sink sources minimum VCONN voltage (see Table 4-5)
tVCONNOFF	0 ms	35 ms	From the time that a Sink is detached or as directed until the VCONN supply is disconnected and bulk capacitance is removed .
tSinkAdj	tRpValueChange (Min)	60 ms	Response time for a Sink to adjust its current consumption to be in the specified range due to a change in USB Type-C Current advertisement

Note:

1. VCONN may be applied prior to the application of VBUS

Figure 4-42 illustrates the timing parameters associated with the DRP toggling process. The [tDRP](#) parameter represents the overall period for a single cycle during which the port is exposed as both a Source and a Sink. The portion of the period where the DRP is exposed as a Source is established by [dcSRC.DRP](#) and the maximum transition time between the exposed states is dictated by [tDRPTransition](#).

Figure 4-42 DRP Timing

Table 4-26 provides the timing values that shall be met for DRPs. The clock used to control DRP swap should not be derived from a precision timing source such as a crystal, ceramic resonator, etc. to help minimize the probability of two DRP devices indefinitely failing to resolve into a Source-to-Sink relationship. Similarly, the percentage of time that a DRP spends advertising Source not be derived from a precision timing source.

Table 4-26 DRP Timing Parameters

	Minimum	Maximum	Description
tDRP	50 ms	100 ms	The period a DRP shall complete a Source to Sink and back advertisement
dcSRC.DRP	30%	70%	The percent of time that a DRP shall advertise Source during tDRP
tDRPTransition	0 ms	1 ms	The time a DRP shall complete transitions between Source and Sink roles during role resolution
tDRPTry	75 ms	150 ms	Wait time associated with the Try.SRC state.
tDRPTryWait	400 ms	800 ms	Wait time associated with the Try.SNK state.
tTryTimeout	<u>550 ms</u>	<u>1100 ms</u>	<u>Timeout for transition from Try.SRC to TryWait.SNK.</u>

Table 4-27 provides the timing requirement for CC connection behaviors.

Table 4-27 CC Timing

	Minimum	Maximum	Description
tCCDebounce	100 ms	200 ms	Time a port shall wait before it can determine it is attached
tPDDebounce	10 ms	20 ms	Time a <u>Sink</u> port shall wait before it can determine it is either detached or there has been a change in USB Type-C current due to the potential for <u>USB PD-BMC</u> signaling on CC as described in the state definitions. The exit condition for the state may not apply this timer.
<u>tTryCCDebounce</u>	<u>10 ms</u>	<u>20 ms</u>	<u>Time a port shall wait before it can determine it is re-attached during the try-wait process.</u>
tErrorRecovery	25 ms		Time a self-powered port shall remain in the <u>ErrorRecovery</u> state.
<u>tRpValueChange</u>	<u>10 ms</u>	<u>20 ms</u>	<u>Time a Sink port shall wait before it can determine there has been a change in Rp where CC is not BMC Idle or the port is unable to detect BMC Idle.</u>
	<u>0 ms</u>	<u>5 ms</u>	<u>Time a Sink port shall wait before it can determine that there has been a change in Rp when USB PD signaling can be detected by the port and CC line is BMC Idle.</u>
<u>tSRCDisconnect</u>	<u>0 ms</u>	<u>20 ms</u>	<u>Time a Source shall detect the SRC.Open state. The Source should detect the SRC.Open state as quickly as practical.</u>

4.11.3 Voltage Parameters

Table 4-28, Table 4-29 and Table 4-30 provide the CC voltage values that a Source shall use to detect what is attached based on the [USB Type-C Current](#) advertisement (Default USB, 1.5 A @ 5 V, or 3.0 A @ 5 V) that the Source is offering.

Table 4-28 CC Voltages on Source Side – Default USB

	Minimum Voltage	Maximum Voltage	Threshold
Powered cable/adapter (vRa)	0.00 V	0.15 V	0.20 V
Sink (vRd)	0.25 V	1.50 V	1.60 V
No connect (vOPEN)	1.65 V		

Table 4-29 CC Voltages on Source Side – 1.5 A @ 5 V

	Minimum Voltage	Maximum Voltage	Threshold
Powered cable/adapter (vRa)	0.00 V	0.35 V	0.40 V
Sink (vRd)	0.45 V	1.50 V	1.60 V
No connect (vOPEN)	1.65 V		

Table 4-30 CC Voltages on Source Side – 3.0 A @ 5 V

	Minimum Voltage	Maximum Voltage	Threshold
Powered cable/adapter (vRa)	0.00 V	0.75 V	0.80 V
Sink (vRd)	0.85 V	2.45 V	2.60 V
No connect (vOPEN)	2.75 V		

Table 4-31 provides the CC voltage values that shall be detected across a Sink's [Rd](#) for a Sink that does not support higher than default [USB Type-C Current](#) Source advertisements.

Table 4-31 Voltage on Sink CC Pins (Default USB Type-C Current only)

Detection	Min voltage	Max voltage	Threshold
vRa	-0.25 V	0.15 V	0.2 V
vRd-Connect	0.25 V	2.18 V	

Table 4-32 provides the CC voltage values that shall be detected across a Sink's [Rd](#) for a Sink that implements detection of higher than default [USB Type-C Current](#) Source advertisements. This table includes consideration for the effect that the IR drop across the cable GND has on the voltage across the Sink's [Rd](#).

Table 4-32 Voltage on Sink CC pins (Multiple Source Current Advertisements)

Detection	Min voltage	Max voltage	Threshold
vRa	-0.25 V	0.15 V	0.2 V
vRd-Connect	0.25 V	2.04 V	
vRd-USB	0.25 V	0.61 V	0.66 V
vRd-1.5	0.70 V	1.16 V	1.23 V
vRd-3.0	1.31 V	2.04 V	

5 Functional Extensions

5.1 Alternate Modes

All hosts and devices (except chargers and clearly marked charge-through ports) using a USB Type-C™ receptacle shall expose a USB interface (minimally USB 2.0). In the case where the host or device optionally supports Alternate Modes:

- The host and device shall use [USB Power Delivery](#) Structured Vendor Defined Messages (Structured VDMs) to discover, configure and enter/exit modes to enable Alternate Modes.
- The device is strongly encouraged to provide equivalent USB functionality where such exists for best user experience.
- Where no equivalent USB functionality is implemented, the device shall provide a USB interface exposing a [USB Billboard Device Class](#) used to provide information needed to identify the device. A device is not required to provide a USB interface exposing a [USB Billboard Device Class](#) for non-user facing modes (e.g., diagnostic modes).

As Alternate Modes do not traverse the USB hub topology, they shall only be used between a directly host connected host and directly to a device.

There are Alternate Mode devices that look like a USB hub – the downstream facing ports of such devices are USB Type-C receptacles that support Alternate Modes. These devices are referred to as Alternate Mode expanders or docks:

- The Alternate Mode port expander's downstream facing USB Type-C receptacles shall expose a USB 2.0 interface.
- An Alternate Mode port expander with the capability to pass USB SuperSpeed through its upstream facing port should expose USB SuperSpeed on its downstream facing USB Type-C receptacles.

5.1.1 Alternate Mode Architecture

The [USB Power Delivery](#) Structured VDMs are defined to extend the functionality a device exposes. Only Structured VDMs shall be used to alter the USB functionality or reconfigure the pins the USB Type-C Connector exposes. Structured VDMs provide a standard method to identify the modes a device supports and to command the device to enter and exit a mode. The use of Structured VDMs are in addition to the normal [USB PD](#) messages used to manage power. Structured VDMs may be interspersed within the normal [USB PD](#) messaging stream, however they shall not be inserted in the middle of an ongoing PD power negotiation.

The Structured VDMs consist of a request followed by a response. The response is either a successful completion of the request (ACK), an indication that the device needs time before it can service a request (BUSY), or a rejection of the request (NAK). A host and device do not enter a mode when either a NAK or BUSY is returned.

Multiple modes may exist and/or function concurrently. For example, a Structured VDM may be used to manage an active cable at the same time that another Structured VDM is used to manage the device so that both the cable and device are operating in a compatible mode.

5.1.2 Alternate Mode Requirements

The host and device shall negotiate a [USB PD](#) Explicit Contract before Structured VDMs may be used to discover or enter an Alternate Mode.

The ACK shall be sent after switching to the Alternate Mode has been completed by the UFP for Enter Mode and Exit Mode requests. See Section 6.4.4 in the [USB Power Delivery Specification](#).

If a device fails to successfully enter an Alternate Mode within [tAMETimeout](#) then the device shall minimally expose a [USB 2.0](#) interface ([USB Billboard Device Class](#)) that is powered by VBUS.

When a device offers multiple modes, especially where multiple Alternate Mode definitions are needed in order to be compatible with multiple host-side implementations, successfully entering an Alternate Mode may be predicated on only one of the available modes being successfully recognized by a host. In this case, the device is not required to expose but may still expose a [USB Billboard Device Class](#) interface to indicate to the host the availability and status of the modes it supports.

The host may send an Enter Mode after [tAMETimeout](#). If the device enters the mode, it shall respond with an ACK and discontinue exposing the [USB Billboard Device Class](#) interface. The device may expose the [USB Billboard Device Class](#) interface again with updated capabilities.

The current supplied over VCONN may be redefined by a specific Alternate Mode but the power shall not exceed the current rating of the pin (See Section 3.7.7.4).

5.1.2.1 Alternate Mode Pin Reassignment

Figure 5-1 illustrates the only pins that shall be available for functional reconfiguration in a full-featured cable. The pins highlighted in yellow are the only pins that shall be reconfigured.

Figure 5-1 Pins Available for Reconfiguration over the Full-Featured Cable

A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1
GND	RX2+	RX2-	VBUS	SBU1	D-	D+	CC	VBUS	TX1-	TX1+	GND
GND	TX2+	TX2-	VBUS	VCONN			SBU2	VBUS	RX1-	RX1+	GND
B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11	B12

Figure 5-2 illustrates the only pins that shall be available for functional reconfiguration in direct connect applications such as a cradle dock, captive cable or a detachable notebook. The pins highlighted in yellow are the only pins that shall be reconfigured. Three additional pins are available because this configuration is not limited by the cable wiring.

Figure 5-2 Pins Available for Reconfiguration for Direct Connect Applications

A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1
GND	RX2+	RX2-	VBUS	SBU1	D-	D+	CC	VBUS	TX1-	TX1+	GND
GND	TX2+	TX2-	VBUS	VCONN			SBU2	VBUS	RX1-	RX1+	GND
B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11	B12

The USB 2.0 data pins (A6, A7) shall remain connected to the USB host controller during entry, while in and during exit of an Alternate Mode.

5.1.2.2 Alternate Mode Electrical Requirements

Signaling during the use of Alternate Modes shall comply with all relevant cable assembly, adapter assembly and electrical requirements of Chapter 3.

Two requirements are specified in order to minimize risk of damage to the USB SuperSpeed transmitters and receivers in a USB host or device:

- When operating in an Alternate Mode and pin pairs A11, A10 (RX1) and B11, B10 (RX2) are used, these shall be AC coupled in or before the USB Type-C plug.
- When operating in an Alternate Mode and pin pairs A2, A3 (TX1) and B2, B3 (TX2) are used, the DC blocking capacitors in the system used on these pin pairs for USB SuperSpeed signaling shall also be used for Alt Mode signaling.
- Alternate Mode signals being received at the USB Type-C receptacle shall not exceed the value specified for VTX-DIFF-PP in Table 6-17 of the [USB 3.1](#) specification.

Direct connect applications shall ensure that any stubs introduced by repurposing the extra D+/D- pair do not interfere with USB communication with compliant hosts that short the pairs of pins together on the receptacle. This can be ensured by placing the Alternate Mode switch close to the plug, by adding inductors to eliminate the stubs at USB 2.0 frequencies, by AC-terminating the long stubs to remove reflections at the cost of attenuated signal, or by other means.

When in an Alternate Mode, activity on the SBU lines shall not interfere with [USB PD](#) BMC communications or interfere with detach detection.

The AC coupling requirement results from the use of AC coupling in the [USB 3.1](#) specification. This requires that the TX signals are AC coupled within the system before the physical connector, ~~but Note~~ that the RX signals ~~are DC~~may be AC coupled within the system. ~~There is thus just one DC blocking capacitor in each connection between the SuperSpeed transmitter PHY and the SuperSpeed receiver PHY as well.~~

Figure 5-3 shows the key components in a typical Alternate Mode implementation using a USB Type-C to USB Type-C full featured cable. This implementation meets the AC coupling requirements, as the capacitors required to be in or before the USB Type-C plug are implemented behind the TX pins in the port partner.

Figure 5-3 Alternate Mode Implementation using a USB Type-C to USB Type-C Cable

It should be noted that the AC capacitor is placed in the system next to the USB Type-C receptacle, so that the system components (the orientation switch, the Alternate Mode selection multiplexer, and other system components) operate within the common mode limits set by the local PHY. This applies, in the USB SuperSpeed operation, to both the transmit path and the receive path within the local system. The receive path is isolated from the common mode of the port partner by the AC cap that is implemented on the TX path in the port partner.

Figure 5-4 shows the key components in a typical Alternate Mode implementation using either a USB Type-C to Alternate Mode connector cable, or a USB Type-C Alternate Mode Direct Attach device. In both cases it is necessary that the system path behind the RX pins on the USB receptacle be isolated from external common mode. This requirement is met by incorporating capacitors in or behind the USB Type-C plug on the Alternate Mode cable or Alternate Mode device.

Figure 5-4 Alternate Mode Implementation using a USB Type-C to Alternate Mode Cable or Device

In the case where the Alt Mode System is required to implement DC blocking capacitors within the system between active system components and the Alt Mode connector, then this provides the necessary isolation and further capacitors in the USB Type-C to Alt Mode adapter cable are not necessary, and may indeed impair signal integrity.

The USB Safe State is defined by the [USB PD](#) specification. The USB Safe State defines an electrical state for the SBU1/2 and SSTX/SSRX for DFPs, UFPs, and Active Cables when transitioning between USB and an Alternate Mode. SBU1/2 and SSTX/SSRX must transition to the USB Safe State before entering to or exiting from an Alternate Mode. Table 5-1 defines the electrical requirements for the USB Safe State. See the [USB-PD](#) Specification for more detail on entry/exit mechanisms to the USB Safe State.

Table 5-1 USB Safe State Electrical Requirements

	SBU1/2	SSTX ^{1,2}	SSRX ²	B6/B7 ⁴
Common-mode voltage	0 to 1.5 V	0 to 1.5 V	0 to 1.5 V	0 to 1.5 V
Impedance to ground³	< 4 MΩ	< 4 MΩ	25 KΩ – 4 MΩ	< 4 MΩ

Notes:

1. SSTX common-mode voltage is defined on the integrated circuit side of the AC coupling capacitors.
2. Unused SSTX and SSRX signals should transition to USB Safe State if wired to the connector but not used.
3. The DFP and UFP shall provide a discharge path to ground in USB Safe State when a connection to the USB Type-C receptacle is present.
4. Applies to docking solutions that redefine pins B6 and B7.

5.1.3 Parameter Values

Table 5-2 provides the timeout requirement for a device that supports Alternate Modes to enable a [USB Billboard Device Class](#) interface when none of the modes supported by the device are successfully recognized and configured by the DFP to which the device is attached.

Table 5-2 USB Billboard Device Class Availability Following Alternate Mode Entry Failure

	Maximum	Description
tAMETimeout	1000 ms	The time between a Sink attach until a USB Billboard Device Class interface is exposed when an Alternate Mode is not successfully entered

While operating in an Alternate Mode, the signaling shall not cause noise ingress onto USB signals operating concurrently that exceeds the Vnoise parameters given in Table 5-3.

Table 5-3 Alternate Mode Signal Noise Ingression Requirements

	Limit	Bandwidth
Vnoise on BMC during BMC Active	30 mV	100 ns time constant filter
Vnoise on BMC during BMC Idle	100 mV	100 ns time constant filter
Vnoise on D+/D- (Single-ended)	40 mV	500 MHz
Vnoise on D+/D- (Differential)	10 mV	500 MHz

Note: Each Vnoise parameter is the max noise ingress level allowed onto the respective interface that is due to two SBU aggressors from the Alternate Mode signaling, under respective worse case scenarios. The coupling between SBU_A/SBU_B and CC within a USB Type-C cable shall meet the requirement described in Section 3.7.2.3.4. The coupling between SBU_A/SBU_B and USB D+/D- within a USB Type-C cable shall meet the requirement described in Section 3.7.2.3.5.

5.1.4 Example Alternate Mode – USB DisplayPort™ Dock

This example illustrates the use of Structured VDMs to expose and access functionality beyond the basic functionality defined by the USB Type-C Connector. The device uses its USB Type-C connector to make connection when placed in a cradle dock. This example only illustrates the functional connections.

5.1.4.1 USB DisplayPort Dock Example

- The cradle dock provides mechanical alignment and attachment in addition to those provided by the USB Type C connector allowing for only one orientation eliminating the need for an orientation MUX in the dock.
- The dock and system use [USB PD](#) to manage charging and power.
- The dock uses DisplayPort to drive a DisplayPort-to-HDMI adapter to support connecting an HDMI monitor.
- The dock has a USB hub that exposes two external USB ports and attached internal USB Devices, e.g. a USB audio Device (a 3.5 mm audio jack), and a USB Billboard Device.

Figure 5-5 illustrates the USB DisplayPort Dock example in a block diagram form.

Figure 5-5 USB DisplayPort Dock Example

The system uses [USB PD](#) Structured VDMs to communicate with the dock to discover that it supports a compatible Alternate Mode. The system then uses a Structured VDM to enter the dock mode. Since [USB PD](#) is used, it may also be used to negotiate power for the system and dock. In this example, the USB SuperSpeed signals allow the dock to work as a USB-only dock when attached to a system that does not fully support the dock or even [USB PD](#).

5.1.4.2 Functional Overview

The following summarizes the behavior resulting from attaching the example USB DisplayPort Dock for three likely host system cases.

1. Host system does not support [USB PD](#) or supports [USB PD](#) without Structured VDMs
 - The host does not support [USB PD](#), or supports [USB PD](#) but not Structured VDMs, so it will not look for SVIDs using the Structured VDM method.
 - The host will discover the USB hub and operates as it would when connected to any USB hub.
 - Since the host will not send an Enter Mode command, after [tAMETimeout](#) the dock will expose a [USB Billboard Device Class](#) interface that the host will enumerate. The host then reports to the user that an unsupported Device has been connected, identifying the type of Device from the [USB Billboard Device Class](#) information.
2. Host system supports [USB PD](#) and Structured VDMs but does not support this specific USB DisplayPort Dock
 - The host discovers the USB hub and operates as it would when connected to any USB hub.
 - The Host looks for SVIDs that it recognizes. The VID associated with this USB DisplayPort Dock may or may not be recognized by the Host.
 - If that VID is recognized by the Host, the Host then requests the modes associated with this VID. The mode associated with this USB DisplayPort Dock is not recognized by the Host.

- Since the host does not recognize the mode as being supported hence will not send the Enter Mode command, after [tAMETimeout](#) the dock will expose a [USB Billboard Device Class](#) interface that the host will enumerate. The host then reports to the user that an unsupported Device has been connected, identifying the type of Device from the [USB Billboard Device Class](#) information.
3. Host system supports this specific USB DisplayPort Dock
- The Host looks for SVIDs that it recognizes. The VID associated with this USB DisplayPort Dock is recognized by the Host.
 - The Host then requests the modes associated with this VID. The mode associated with this USB/Display Dock is recognized by the Host.
 - Since this mode is recognized as supported, the Host uses the Enter Mode command to reconfigure the USB Type-C receptacle and enter the USB DisplayPort Dock mode.
 - The USB DisplayPort Dock may optionally expose the [USB Billboard Device Class](#) interface to provide additional information to the OS.

5.1.4.3 Operational Summary

The following summarizes the basic process of discovery through configuration when the USB DisplayPort Dock is attached to the Host.

1. Host detects presence of a device (CC pins) and connector orientation
2. Host applies default VBUS
3. Host applies VCONN because the dock presents [Ra](#)
4. Host uses [USB PD](#) to make power contract with the USB DisplayPort Dock
5. Host runs the Discover Identify process
 - a. Sends Discover Identity message
 - b. Receives an ACK message with information identifying the cable
6. Host runs the Discover SVIDs process
 - a. Sends Discover SVID message
 - b. Receives an ACK message with list of SVIDs for which the Dock device has modes
7. Host runs the Discover Modes process
 - a. Sends Discover Modes VDM for the VIDs previously discovered
 - b. Receives an ACK message with a list of modes associated with each VID
 - c. If USB DisplayPort Dock mode not found, dock will timeout and present the [USB Billboard Device Class](#) interface and the OS will inform the user of the error - done
 - d. Else
8. Host runs the Enter Mode process
 - a. Sends Enter Mode VDM with VID and USB DisplayPort Dock mode
 - b. Receives an ACK message – Host is now attached to the USB DisplayPort Dock and supports DisplayPort signaling to interface additional functions in combination with USB signaling

9. Host stays in the USB DisplayPort Dock mode until
 - a. Explicitly exited by an Exit Mode VDM
 - b. System physically disconnected from the USB DisplayPort Dock
 - c. Hard Reset on [USB PD](#)
 - d. VBUS is removed

5.2 Managed Active Cables

~~Active cables that require configuration (Managed active cable) shall use Structured VDMs to discover and configure the cable.~~

~~Structured VDMs provide a standardized mechanism for identifying and managing the functionality of active cables.~~

~~Some managed active cables only cables may have a single [USB PD](#) controller in the cable that responds to [USB PD](#) Structured VDMs sent to SOP'.~~

~~When a managed active cable requires if independent management at of each end of the cable, separate controllers responding to Structured VDMs sent to SOP' and SOP" can be located in each plug is not required.~~

~~All managed active cables shall identify if they respond to SOP' only or to both SOP' and SOP" using the Discover Identity command defined in [USB Power Delivery](#).~~

5.2.1 Requirements for Managed Active Cables that respond to SOP' and SOP"

~~After a power-on reset event or a Hard Reset, the controller attached to the Source is assigned SOP' and the controller attached to the Sink is assigned SOP". After a Cable Reset, the plug being supplied VCONN responds to SOP' independent of whether it is the plug attached to the Source or Sink. The controllers can sense whether they are SOP' or SOP" based on the presence of VCONN at the plug's VCONN pin as only one port supplies VCONN.~~

~~illustrates the process that shall be followed to assign SOP' and SOP" to the ends attached to the Source and Sink, respectively, at power on. In the Unassigned state, the active cable will not respond to any communication sent to SOP' or SOP". The parameter allows time for the active cable to set up to communicate.~~

~~Figure Managed active cables shall implement the Cable Plug SOP' State Machine defined in Section 4.5.2.4 and Figure 4-20 SOP" Assignment.~~

~~When VCONN is removed, the plug's local VCONN shall discharge to below its SOP' detection threshold within 20 ms.~~

A managed active cable ~~shall assure that the which supports~~ two [USB PD](#) controllers ~~shall ensure the cable plugs~~ are uniquely assigned via the mechanism described here, one as SOP' and the other as SOP".

[USB PD](#) supports three types of USB Type-C-related swaps that may or may not impact VCONN:

- [USB PD](#) VCONN_Swap – The port previously not supplying VCONN sources VCONN and the assignment of SOP' and SOP" remain unchanged.
- [USB PD](#) DR_Swap – The assignment of SOP' and SOP" remain unchanged.

- [USB PD](#) PR_Swap – The assignment of SOP' and SOP" remain unchanged.

Managed active USB Type-C to USB Type-C cables shall by default support USB operation. **Multi**-Modal cables (e.g., an active cable that supports an [Alternate Mode](#) in addition to USB SuperSpeed) that use the TX/RX signal pairs shall minimally support [USB 3.1](#) Gen 1 operation. **They and** are encouraged to support both Gen 1 and Gen 2 operation.

Figure 5-6 illustrates a typical managed active cable. The isolation elements (Iso) shall prevent VCONN from traversing end-to-end through the cable. **R_a is required in the cable must be present when no VCONN is applied** to allow the DFP to determine that VCONN is needed.

Figure 5-6 Managed Active Cable

5.2.1.1 Parameter Values

~~provides the power on timing requirements for SOP' and SOP" to be ready to communicate.~~

Table – SOP' and SOP" Timing

	Maximum	Description
t_{VCONNStable}	50 ms	The time between the application of V_{CONN} until SOP' and SOP" shall be ready for communication.

5.2.2 Cable Message Structure

USB PD Structured VDMs shall be used to identify and manage active cables. Cables that require additional functionality, for example to program parameters in the active electronics, may define proprietary Structured VDMs to provide the necessary functionality. In all cases, these messages shall only use SOP' and SOP". They shall not use SOP.

SOP' and SOP" are defined to allow a vendor to communicate individually with each end the cable end.

~~For active cables that support both SOP' and SOP", after attach or a Cable Reset, the plug directly connected to the Source shall only respond to SOP' and the plug directly connected to the Sink shall only respond to SOP".~~

~~The assignment of SOP' and SOP" to each plug remains persistent until V_{CONN} is removed or a subsequent Cable Reset.~~

The Discover Identity message shall start with SOP'.

5.2.3 Modal Cable Management

In addition to supporting the Discover Identity message, managed active cables shall support the following USB Power Delivery Structured VDMs. These VDMs shall start with SOP'.

5.2.3.1 Discover SVIDs

The managed active cable shall return a list of SVIDs that it supports.

5.2.3.2 Discover Modes

The managed active cable shall return a list of Alternate Modes it supports for each SVID.

5.2.3.3 Enter Mode

The managed active cable shall use the Enter Mode command to enter an Alternate Mode. The behavior of the cable following Enter Mode is vendor specific.

5.2.3.4 Exit Mode

The managed active cable shall use the Exit Mode command to exit an Alternate Mode previously entered. Exit Mode shall return the cable to its default USB operation.

A Audio Adapter Accessory Mode

A.1 Overview

Analog audio headsets are supported by multiplexing four analog audio signals onto pins on the USB Type-C™ connector when in the Audio Adapter Accessory Mode. The four analog audio signals are the same as those used by a traditional 3.5 mm headset jack. This makes it possible to use existing analog headsets with a 3.5 mm to USB Type-C adapter. The audio adapter architecture allows for an audio peripheral to provide up to 500 mA back to the system for charging.

An analog audio adapter could be a very basic USB Type-C adapter that only has a 3.5 mm jack or it could be an analog audio adapter with a 3.5 mm jack and a USB Type-C receptacle to enable charge-through. The analog audio headset shall not use a USB Type-C plug to replace the 3.5 mm plug.

A USB host that implements support for USB Type-C Analog Audio Adapter Accessory mode shall also support USB Type-C Digital Audio (TCDA) with nominally equivalent functionality and performance. A USB device that implements support for USB Type-C Analog Audio Adapter Accessory mode should also support TCDA with nominally equivalent audio functionality and performance.

A.2 Detail

An analog audio adapter shall use a captive cable with a USB Type-C plug or include an integrated USB Type-C plug.

The analog audio adapter shall identify itself by presenting a resistance to GND of $\leq Ra$ on both A5 (CC) and B5 (VCONN) of the USB Type-C plug. If pins A5 and B5 are shorted together, the effective resistance to GND shall be less than $Ra/2$.

A DFP that supports analog audio adapters shall detect the presence of an analog audio adapter by detecting a resistance to GND of less than Ra on both A5 (CC) and B5 (VCONN).

Table A-1 shows the pin assignments at the USB Type-C plug that shall be used to support analog audio.

Table A-1 USB Type-C Analog Audio Pin Assignments

Plug Pin	USB Name	Analog Audio Function	Location on 3.5 mm Jack	Notes
A5	CC			Connected to digital GND with resistance $\leq R_a$. System uses for presence detect.
B5	VCONN			Connected to digital GND with resistance $\leq R_a$. System uses for presence detect.
A6/B6	Dp	Right	Ring 1	Analog audio right channel A6 and B6 shall be shorted together in the adapter.
A7/B7	Dn	Left	Tip	Analog audio left channel A7 and B7 shall be shorted together in the adapter.
A8	SBU1	Mic/AGND	Ring 2	Analog audio microphone (OMTP & YD/T) or Audio GND (CTIA).
B8	SBU2	AGND/Mic	Sleeve	Audio GND (OMTP & YD/T or analog audio microphone (CTIA).
A1/A12 B1/B12	GND			Digital GND (DGND) used as the ground reference and current return for CC1, CC2, and VBUS.
A4/A9 B4/B9	VBUS			Not connected unless the audio adapter uses this connection to provide 5 V @ 500 mA for charging the system's battery.
Others				Other pins shall not be connected.

The analog audio signaling presented by the headset on the 3.5 mm jack is expected to comply with at least one of the following:

- The traditional American headset jack pin assignment, with the jack sleeve used for the microphone signal, supported by CTIA-The Wireless Association
- “Local Connectivity: Wired Analogue Audio” from the Open Mobile Terminal Forum (OMTP) forum
- “Technical Requirements and Test Methods for Wired Headset Interface of Mobile Communication Terminal” (YT/D 1885-2009) from the China Communications Standards Association

When in the Audio Adapter Accessory Mode, the system shall not provide VCONN power on either CC1 or CC2. Failure to do this may result in VCONN being shorted to GND when an analog audio peripheral is present.

The system shall connect A6/B6, A7/B7, A8 and B8 to an appropriate audio codec upon entry into the Audio Adapter Accessory Mode. The connections for A8 (SBU1) and B8 (SBU2) pins are dependent on the adapter's orientation. Depending on the orientation, the microphone and analog ground pins may be swapped. These pins are already reversed between the two major standards for headset jacks and support for this is built into the headset connection of many codecs or can be implemented using an autonomous audio headset switch. The system shall work correctly with either configuration.

A.3 Electrical Requirements

The maximum ratings for pin voltages are referenced to GND (pins A1, A12, B1, and B12). The non-GND pins on the plug shall be isolated from GND on the USB Type-C connector and shall be isolated from the USB plug shell. To minimize the possibility of ground loops

between systems, AGND shall be connected to GND only within the system containing the USB Type-C receptacle. Both the system and audio device implementations shall be able to tolerate the Right, Left, Mic, and AGND signals being shorted to GND. The current provided by the amplifier driving the Right and Left signals shall not exceed ± 150 mA per audio channel, even when driving a $0\ \Omega$ load.

Table A-2 shows allowable voltage ranges on the pins in the USB Type-C plug that shall be met.

Table A-2 USB Type-C Analog Audio Pin Electrical Parameter Ratings

Plug Pin	USB Name	Analog Audio Function	Min	Max	Units	Notes
A6/B6	Dp	Right	-3.0	3.0	V	A6 and B6 shall be shorted together in the analog audio adapter
A7/B7	Dn	Left	-3.0	3.0	V	A7 and B7 shall be shorted together in the analog audio adapter
A8	SBU1	Mic/AGND	-0.4	3.3	V	
B8	SBU2	AGND/Mic	-0.4	3.3	V	

The maximum voltage ratings for Left and Right signals are selected to encompass a 2 Vrms sine wave ($2.828\text{ V}_p = 5.657\text{ V}_{pp} = 6\text{ dBV}$) which is a common full-scale voltage for headset audio output.

Headset microphones operate on a positive bias voltage provided by the system's audio codec and AC-couple the audio signal onto it. Some headsets may produce an audio signal level up to 0.5 Vrms ($0.707\text{ V}_p = 1.414\text{ V}_{pp} = -6\text{ dBV}$) but this is biased so that the voltage does not swing below GND. The bias voltage during operation is typically around 1.25 V but it varies quite a bit depending on the specifics of the manufacturer's design, therefore the maximum voltage rating for the SBU pins is selected to allow a variety of existing solutions.

While one SBU pin carries the Mic signal, the other SBU pin serves as AGND carrying the return current for Left, Right, and Mic. If we assume a worst-case headset speaker impedance of $16\ \Omega$ per speaker, then the worst-case return current for the speakers is ± 0.2 A. If we assume that the worst-case resistance from the AGND pin to GND within the USB Type-C system is $1\ \Omega$ (due to FET R_{ON} within the signal multiplexer, contact, and trace resistances), then the voltage of the AGND pin with respect to USB Type-C GND can vary between ± 0.2 V. The minimum voltage rating for the SBU pins has been selected to allow for this scenario with some additional margin to account for Mic signal return current and tolerances.

The system shall exhibit no more than -48 dB linear crosstalk between the Left and Right audio channels and exhibit no more than -51 dB linear crosstalk from the Left or Right channel to the Mic channel. Crosstalk measurements shall be made using a measurement adapter plug that supports USB Type-C analog audio connections according to Table A-1. In the measurement adapter, the Left and Right channels are terminated with $32\ \Omega$ resistors to AGND, the Mic channel is terminated with $2k\ \Omega$ resistor to AGND; AGND is connected to USB Type-C Plug Pin A8, and the Mic channel is connected to USB Type-C Plug Pin B8.

Crosstalk shall be measured by using the system to drive a sine wave signal to the Left output channel and zero signal to the Right output channel. The system shall configure the Mic channel according to the default Mic operating mode supported by the system. AC voltage levels at the Left, Right and Mic channels are measured across the corresponding termination resistors using a third-octave filter at the sine signal frequency. Left - Right

crosstalk is reported as ratio of the Right channel voltage to the Left channel voltage expressed in decibels. Similarly, the Left – Mic crosstalk is reported. The measurements shall be conducted at 31.5, 63, 125, 250, 500, 1000, 2000, 4000, 8000 and 16000 Hz frequencies. The measurements shall be repeated so that the sine wave signal is driven to the Right channel and Right – Left and Right – Mic crosstalk results are obtained. Both USB Type-C plug orientations shall be measured.”

A.4 Example Implementations

A.4.1 Passive 3.5 mm to USB Type-C Adapter – Single Pole Detection Switch

Figure A-1 illustrates how a simple 3.5 mm analog audio adapter can be made. In this design, there is an audio plug that contains a single-pole detection switch that is used to completely disconnect the CC and VCONN pins from digital GND when no 3.5 mm plug is inserted. This has the effect of triggering the USB Type-C presence detect logic upon insertion or removal of either the 3.5 mm plug or the audio adapter itself.

Figure A-1 Example Passive 3.5 mm to USB Type-C Adapter

A.4.2 3.5 mm to USB Type-C Adapter Supporting 500 mA Charge-Through

Figure A-2 illustrates a 3.5 mm analog audio adapter that supports charge-through operation. Charging power comes into the adapter through a USB Type-C receptacle and is routed directly to the adapter's USB Type-C plug, which is plugged into the device being charged. This design is limited to providing 500 mA of charge-through current since it has no way to advertise greater current-sourcing capability. The USB Type-C receptacle presents Rd on both of its CC pins because a CC pull-down must be present for the receptacle to indicate that it wants to consume VBUS current. USB Type-C systems that support analog audio should ensure that charging is not interrupted by insertion or removal of the 3.5 mm audio plug and that audio is not interrupted by insertion or removal of the cable connected

to the audio adapter's USB Type-C receptacle by using the system's presence detection logic monitoring the states of both the CC1 and CC2 pins and VBUS.

Figure A-2 Example 3.5 mm to USB Type-C Adapter Supporting 500 mA Charge-Through

B Debug Accessory Mode

B.1 Overview

This appendix covers the functional requirements for the USB Type-C Debug Accessory Mode (DAM), Debug and Test System (DTS), and Target System (TS). The USB Type-C connector is ideal for debug of closed-chassis, form-factor devices. Debug covers many areas, ranging from detailed JTAG Test Access Port (TAP)-level debug in a lab to high-level debug of software applications in production. Lab debug requires early debug access to hardware registers soon after reset, whereas software debug uses kernel debuggers, etc. to access software state. Debug Accessory Mode in USB Type-C enables debug of closed-chassis, form-factor devices by re-defining the USB Type-C ports for debug purposes.

Basic debug requirements are defined as a standard feature, and additional debug features may be added as per vendor specifications.

B.2 Functional

The USB Type-C Debug Accessory Mode follows a layered structure as shown in Figure B-1, defining the minimum physical layer for Attach, Detection and Power. Orientation detection is optional normative. The transport layer is left proprietary and is not covered in this document.

Figure B-1 USB Type-C Debug Accessory Layered Behavior

B.2.1 Signal Summary

Figure B-2 shows the pin assignments of the DTS plug that are used to support DAM. The pins highlighted in yellow are those available to be configured for debug signals. Both CC1 and CC2 are used for current advertisement and optional orientation detection.

Figure B-2 DTS Plug Interface

A12	A11	A10	A9	A8	A7	A6	A5	A4	A3	A2	A1
GND	RX2+	RX2-	VBUS	SBU1	D-	D+	CC1	VBUS	TX1-	TX1+	GND
GND	TX2+	TX2-	VBUS	CC2	D+	D-	SBU2	VBUS	RX1-	RX1+	GND
B1	B2	B3	B4	B5	B6	B7	B8	B9	B10	B11	B12

The DTS and TS must follow the USB Safe State detailed in Section 5.1.2.2 at all times (whether in DAM or not).

B.2.2 Port Interoperability

Table B-1 summarizes the expected results when interconnecting a DTS Source, Sink or DRP port to a TS Source, Sink or DRP port.

Table B-1 DTS to TS Port Interoperability

	DTS Source	DTS Sink	DTS DRP
TS Sink	Functional	Non-functional ¹	Functional
TS Sink w/ Accessory Support	Functional	Non-functional ¹	Functional
TS DRP	Functional	Functional	Functional
TS Source	Non-functional ¹	Functional	Functional

1. In the cases where no function results, neither port shall be harmed by this connection. Following the USB Safe State ensures this.

B.2.3 Debug Accessory Mode Entry

The typical flow for the configuration of the interface in the general case of a DTS to a TS is as follows:

1. Detect a valid connection between the DTS (Source, Sink, or DRP) and TS (Source, Sink, or DRP)
2. Optionally determine orientation of the plug in the receptacle
3. Optionally establish [USB PD](#) communication over CC for advanced power delivery negotiation and alternate modes. [USB PD](#) communication is allowed only if the optional orientation of the plug is determined.
4. Establish test access connections with the available USB Type-C signals

The DTS DRP will connect as either a Source or a Sink, but its state diagram gives preference to the Source role.

B.2.3.1 Detecting a Valid DTS-to-TS Connection

The general concept for setting up a valid connection between a DTS and TS is based on being able to detect the typical USB Type-C termination resistances. However, detecting a Debug Accessory Mode connection requires that both CC pins must detect a pull-up ([Rp](#)) or pull-down ([Rd](#)) termination. A USB Type-C Cable does not pass both CC wires so a receptacle to receptacle Debug Accessory Mode connection cannot be detected.

A DTS is only allowed to connect to a TS that is presenting either [Rp/Rp](#) or [Rd/Rd](#). Otherwise, the TS does not support Debug Accessory Mode.

To detect either an [Rp/Rp](#) or [Rd/Rd](#), the DTS must be a captive cable or a direct-attach device with a USB Type-C plug and the TS must have a USB Type-C receptacle.

B.2.4 Connection State Diagrams

This section provides reference connection state diagrams for CC-based behaviors of the DTS. The TS connection state diagrams are found in Section 4.5.2.

Refer to Section B.2.4.1 for the specific state transition requirements related to each state shown in the diagrams.

Refer to Section B.2.4.3 for a description of which states are mandatory for each port type and a list of states where [USB PD](#) communication is permitted.

Figure B-3 illustrates a connection state diagram for a DTS Source.

Figure B-3 Connection State Diagram: DTS Source

Figure B-4 illustrates a connection state diagram for a simple DTS Sink.

Figure B-4 Connection State Diagram: DTS Sink

Figure B-5 illustrates a connection state diagram for a DTS DRP.

Figure B-5 Connection State Diagram: DTS DRP

B.2.4.1 Connection State Machine Requirements

The DTS state machine requirements follow those outlined in Section 4.5.2.2 for the general USB Type-C state machines with the additional following states defined.

Note, VCONN shall not be driven by any DTS or TS port in any state.

B.2.4.1.1 Exiting From ErrorRecovery State

This state appears in Figure B-3, Figure B-4, and Figure B-5.

The ErrorRecovery state is where the DTS cycles its connection by removing all terminations from the CC pins for [tErrorRecovery](#) followed by transitioning to the appropriate [UnattachedDeb.SNK](#) or [UnattachedDeb.SRC](#) state based on DTS type.

The DTS should transition to the [ErrorRecovery](#) state from any other state when directed.

A DTS may choose not to support the [ErrorRecovery](#) state. If the [ErrorRecovery](#) state is not supported, the DTS shall be directed to the [Disabled](#) state if supported. If the Disabled state is not supported, the DTS shall be directed to either the [UnattachedDeb.SNK](#) or [UnattachedDeb.SRC](#) states.

A DTS Sink shall transition to [UnattachedDeb.SNK](#) after [tErrorRecovery](#).

A DTS Source shall transition to [UnattachedDeb.SRC](#) after [tErrorRecovery](#).

A DTS DRP shall transition to [UnattachedDeb.SRC](#) after [tErrorRecovery](#).

B.2.4.1.2 UnattachedDeb.SNK State

This state appears in Figure B-4 and Figure B-5.

When in the [UnattachedDeb.SNK](#) state, the DTS is waiting to detect the presence of a TS Source.

A DTS with a dead battery shall enter this state while unpowered.

B.2.4.1.2.1 UnattachedDeb.SNK Requirements

The DTS shall not drive VBUS.

Both CC pins shall be independently terminated to ground through [Rd](#).

B.2.4.1.2.2 Exiting from UnattachedDeb.SNK State

The DTS shall transition to [AttachWaitDeb.SNK](#) when a TS Source connection is detected, as indicated by the [SNK.Rp](#) state on both of its CC pins.

A DTS DRP shall transition to [UnattachedDeb.SRC](#) within [tDRPTransition](#) after the state of one or both CC pins is [SNK.Open](#) for [tDRP - dcSRC.DRP · tDRP](#), or if directed.

B.2.4.1.3 AttachWaitDeb.SNK State

This state appears in Figure B-4 and Figure B-5.

When in the [AttachWaitDeb.SNK](#) state, the DTS has detected the [SNK.Rp](#) state on both CC pins and is waiting for VBUS.

B.2.4.1.3.1 AttachWaitDeb.SNK Requirements

The requirements for this state are identical to [UnattachedDeb.SNK](#).

B.2.4.1.3.2 Exiting from AttachWaitDeb.SNK State

A DTS Sink shall transition to [UnattachedDeb.SNK](#) when the state of one or both CC pins is [SNK.Open](#) for at least [tPDDebounce](#).

A DTS DRP shall transition to [UnattachedDeb.SRC](#) when the state of one or both CC pins is [SNK.Open](#) for at least [tPDDebounce](#).

A DTS Sink shall transition to [AttachedDeb.SNK](#) when neither CC pin is [SNK.Open](#) after [tCCDebounce](#) and VBUS is detected.

A DTS DRP shall transition to [TryDeb.SRC](#) when neither CC pin is [SNK.Open](#) after [tCCDebounce](#) and VBUS is detected.

B.2.4.1.4 AttachedDeb.SNK State

This state appears in Figure B-4 and Figure B-5.

When in the [AttachedDeb.SNK](#) state, the DTS is attached and operating as a DTS Sink.

B.2.4.1.4.1 AttachedDeb.SNK Requirements

This mode is for debug only

The port shall not drive VBUS.

The port shall provide an [Rd](#) as specified in Table 4-15 on both CC pins if orientation is not needed. See Section B.2.6 for orientation detection.

The port shall source current on both CC pins and monitor to detect when VBUS is removed.

If the DTS needs to establish a [USB PD](#) communications, it shall do so only after entry to this state. In this state, the DTS takes on the initial [USB PD](#) role of UFP/Sink.

The DTS shall connect the debug signals for [Debug Accessory Mode](#) operation only after entry to this state.

The DTS may follow the DAM Sink Power Sub-State behavior specified in Section 4.5.2.3.

B.2.4.1.4.2 Exiting from AttachedDeb.SNK State

A DTS shall transition to [UnattachedDeb.SNK](#) when VBUS is no longer present

B.2.4.1.5 UnattachedDeb.SRC State

This state appears in Figure B-3 and Figure B-5.

When in the [UnattachedDeb.SRC](#) state, the DTS is waiting to detect the presence of a TS Sink

B.2.4.1.5.1 UnattachedDeb.SRC Requirements

The DTS shall not drive VBUS.

The DTS shall source current on both CC pins independently.

The DTS shall provide a unique [Rp](#) value on each CC pin as specified in Section 4.5.2.3.

B.2.4.1.5.2 Exiting from UnattachedDeb.SRC State

The DTS shall transition to [AttachWaitDeb.SRC](#) when the [SRC.Rd](#) state is detected on both CC pins.

A DTS DRP shall transition to [UnattachedDeb.SNK](#) within [tDRPTransition](#) after [dcSRC.DRP · tDRP](#), or if directed.

B.2.4.1.6 AttachWaitDeb.SRC State

This state appears in Figure B-3 and Figure B-5.

The [AttachWaitDeb.SRC](#) state is used to ensure that the state of both of the CC pins is stable after a TS Sink is connected.

B.2.4.1.6.1 AttachWaitDeb.SRC Requirements

The requirements for this state are identical to [UnattachedDeb.SRC](#).

B.2.4.1.6.2 Exiting from AttachWaitDeb.SRC State

The DTS shall transition to [AttachedDeb.SRC](#) when VBUS is at vSafe0V and the [SRC.Rd](#) state is detected on both of the CC pins for at least [tCCDebounce](#).

A DTS Source shall transition to [UnattachedDeb.SRC](#) and a DTS DRP to [UnattachedDeb.SNK](#) when the [SRC.Open](#) state is detected on either of the CC pins.

B.2.4.1.7 AttachedDeb.SRC State

This state appears in Figure B-3 and Figure B-5.

When in the [AttachedDeb.SRC](#) state, the DTS is attached and operating as a DTS Source.

B.2.4.1.7.1 AttachedDeb.SRC Requirements

The DTS shall provide a unique [Rp](#) value on each CC pin as specified in Section B.2.4.2.

The DTS shall supply VBUS current at the level it advertises. See Section B.2.6.1.1 for advertising current level.

The DTS shall supply VBUS within [tVbusOn](#) of entering this state, and for as long as it is operating as a power source.

If the DTS needs to establish [USB PD](#) communications, it shall do so only after entry to this state. The DTS shall not initiate any [USB PD](#) communications until VBUS reaches vSafe5V. In this state, the DTS takes on the initial [USB PD](#) role of DFP/Source.

The DTS shall connect the debug signals for [Debug Accessory Mode](#) operation only after entry to this state.

B.2.4.1.7.2 Exiting from AttachedDeb.SRC State

A DTS Source shall transition to [UnattachedDeb.SRC](#) when the [SRC.Open](#) state is detected on either CC pin.

A DTS DRP shall transition to [UnattachedDeb.SNK](#) when [SRC.Open](#) is detected on either CC pin.

A DTS shall cease to supply VBUS within [tVbusOff](#) of exiting [AttachedDeb.SRC](#).

B.2.4.1.8 TryDeb.SRC State

This state appears in Figure B-5.

When in the [TryDeb.SRC](#) state, the DTS DRP is querying to determine if the TS is also a DRP, to favor the DTS taking the Source role.

B.2.4.1.8.1 TryDeb.SRC Requirements

The DTS shall not drive VBUS.

The DTS shall source current on both CC pins independently.

The DTS shall provide a unique [Rp](#) value on each CC pin as specified in Section B.2.4.2.

B.2.4.1.8.2 Exiting from TryDeb.SRC State

The DTS shall transition to [AttachedDeb.SRC](#) when the [SRC.Rd](#) state is detected on both CC pins for at least [tTryCCDebounce](#).

The DTS shall transition to [TryWaitDeb.SNK](#) after [tDRPTry](#) if the state of both CC pins is not [SRC.Rd](#).

B.2.4.1.9 TryWaitDeb.SNK State

This state appears in Figure B-5.

When in the [TryWaitDeb.SNK](#) state, the DTS has failed to become a DTS Source and is waiting to attach as a DTS Sink.

B.2.4.1.9.1 TryWaitDeb.SNK Requirements

The DTS shall not drive V_{BUS}.

Both CC pins shall be independently terminated to ground through [R_d](#).

B.2.4.1.9.2 Exiting from TryWaitDeb.SNK State

The DTS shall transition to [AttachedDeb.SNK](#) when neither CC pin is [SNK.Open](#) after [tCCDebounce](#) and V_{BUS} is detected.

The DTS shall transition to [UnattachedDeb.SNK](#) when the state of one of the CC pins is [SNK.Open](#) for at least [tPDDebounce](#) or if V_{BUS} is not detected within [tPDDebounce](#).

B.2.4.2 Power Sub-State Requirements

B.2.4.2.1 TS Sink Power Sub-State Requirements

When in the [DebugAccessory.SNK](#) state and the DTS Source is supplying default V_{BUS}, the TS Sink shall operate in one of the sub-states shown in Figure B-6. The initial TS Sink Power Sub-State is [PowerDefaultDeb.SNK](#). Subsequently, the TS Sink Power Sub-State is determined by the DTS Source's USB Type-C current advertisement determined by the [R_p](#) value on each CC pin as shown in Table B-2. The TS Sink in the attached state shall remain within the TS Sink Power Sub-States until either V_{BUS} is removed or a *USB PD* contract is established with the Source.

The TS Sink is only required to implement TS Sink Power Sub-State transitions if the TS Sink wants to consume more than default USB current.

Note, a TS Source will not use the values in Table B-2. A TS Source will present the same [R_p](#) on each CC pin using the standard [R_p](#) value for the desired current advertisement.

Figure B-6 TS Sink Power Sub-States**Table B-2 Rp/Rp Charging Current Values for a DTS Source**

Mode of Operation	CC1	CC2
Default USB Power	Rp for 3 A	Rp for 1.5 A
USB Type-C Current @ 1.5 A	Rp for 1.5 A	Rp for Default
USB Type-C Current @ 3 A	Rp for 3 A	Rp for Default

B.2.4.2.2 PowerDefaultDeb.SNK Sub-State

This sub-state supports DAM Sinks consuming current within the lowest range (default) of Source-supplied current.

B.2.4.2.2.1 PowerDefaultDeb.SNK Requirements

The port shall draw no more than the default USB power from VBUS. See Section 4.6.2.1.

If the DTS Sink wants to consume more than the default USB power, it shall monitor [vRd](#) on both CC pins to determine if more current is available from the Source.

B.2.4.2.2.2 Exiting from PowerDefaultDeb.SNK

For any change on CC indicating a change in allowable power, the DAM Sink shall not transition until the new [vRd](#) voltages on each CC pin have been stable for at least [tRpValueChange](#).

For [vRd](#) voltages on the CC pins indicating 1.5 A mode, the DAM Sink shall transition to the [Power1.5Deb.SNK](#) Sub-State.

For [vRd](#) voltages on the CC pins indicating 3 A mode, the DAM Sink shall transition to the [Power3.0Deb.SNK](#) Sub-State.

B.2.4.2.3 Power1.5Deb.SNK Sub-State

This sub-state supports DAM Sinks consuming current within the two lower ranges (default and 1.5 A) of DAM Source-supplied current.

B.2.4.2.3.1 Power1.5Deb.SNK Requirements

The DAM Sink shall draw no more than 1.5 A from VBUS.

The DAM Sink shall monitor both [vRd](#) voltages while it is in this sub-state.

B.2.4.2.3.2 Exiting from Power1.5Deb.SNK

For any change on the CC pins indicating a change in allowable power, the DAM Sink shall not transition until the new [vRd](#) voltages on both CC pins have been stable for at least [tRpValueChange](#).

For [vRd](#) voltages on the CC pins indicating Default USB Power mode, the port shall transition to the [PowerDefaultDeb.SNK](#) Sub-State and reduce its power consumption to the new range within [tSinkAdj](#).

For [vRd](#) voltages on the CC pins indicating 3 A mode, the port shall transition to the [Power3.0Deb.SNK](#) Sub-State.

B.2.4.2.4 Power3.0Deb.SNK Sub-State

This sub-state supports DAM Sinks consuming current within all three ranges (default, 1.5 A and 3.0 A) of DAM Source-supplied current.

B.2.4.2.4.1 Power3.0Deb.SNK Requirements

The port shall draw no more than 3.0 A from VBUS.

The port shall monitor both [vRd](#) voltages while it is in this sub-state.

B.2.4.2.4.2 Exiting from Power3.0Deb.SNK

For any change on the CC pins indicating a change in allowable power, the port shall not transition until the new [vRd](#) voltages on both CC pins have been stable for at least [tRpValueChange](#).

For [vRd](#) voltages on the CC pins indicating Default USB Power mode, the port shall transition to the [PowerDefaultDeb.SNK](#) Sub-State and reduce its power consumption to the new range within [tSinkAdj](#).

For [vRd](#) voltages on the CC pins indicating 1.5 A mode, the DAM Sink shall transition to the [Power1.5Deb.SNK](#) Sub-State.

B.2.4.2.5 DTS Sink Power Sub-State Requirements

A DTS Sink follows the same power sub-states defined in Section 4.5.2.3. The TS Source will be advertising current with a standard [Rp](#) value that is the same for each CC pin. If optional orientation detection is performed, the DTS Sink will only be able to determine the [Rp](#) value from the CC pin that is set for [USB PD](#) communication.

B.2.4.3 Connection States Summary

Table B-3 defines the mandatory and optional states for each type of port. For states allowing [USB PD](#) communication, DAM connections requiring [USB PD](#) communication shall determine orientation by the steps described in Section B.2.6.

Table B-3 Mandatory and Optional States

	DTS Source	DTS SINK	DTS DRP	USB PD Communication and/or Debug Signal Activity
UnattachedDeb.SNK	N/A	Mandatory	Mandatory	Not Permitted
AttachWaitDeb.SNK	N/A	Mandatory	Mandatory	Not Permitted
AttachedDeb.SNK	N/A	Mandatory	Mandatory	Permitted
UnattachedDeb.SRC	Mandatory	N/A	Mandatory	Not Permitted
AttachWaitDeb.SRC	Mandatory	N/A	Mandatory	Not Permitted
AttachedDeb.SRC	Mandatory	N/A	Mandatory	Permitted
TryDeb.SRC	N/A	N/A	Mandatory	Not Permitted
TryWaitDeb.SNK	N/A	N/A	Mandatory	Not Permitted

B.2.5 DTS Port Interoperability Behavior

This section describes interoperability behavior between DTS ports and TS ports.

B.2.5.1 DTS Port to TS Port Interoperability Behaviors

The following sub-sections describe typical port-to-port interoperability behaviors for the various combinations of DTS and TS Sources, Sinks and DRPs as presented in Table B-1.

B.2.5.1.1 DTS Source to TS Sink Behavior

The following describes the behavior when a DTS Source is connected to a TS Sink.

1. DTS Source and TS Sink in the unattached state
2. DTS Source transitions from [UnattachedDeb.SRC](#) to [AttachedDeb.SRC](#) through [AttachWaitDeb.SRC](#)
 - DTS Source detects the TS Sink's pull-downs on both CC pins and enters [AttachWaitDeb.SRC](#). After [tCCDebounce](#) it then enters [AttachedDeb.SRC](#)
 - [DTS Source turns on VBUS](#)
 - [DTS Source turns on VBUS](#)
3. TS Sink transitions from [Unattached.SNK](#) to [DebugAccessory.SNK](#) through [AttachWait.SNK](#)
 - TS Sink in [Unattached.SNK](#) detects the DTS Source's pull-ups on both CC pins and enters [AttachWait.SNK](#). After that state persists for [tCCDebounce](#) and it detects VBUS, it enters [DebugAccessory.SNK](#)
4. While the DTS Source and TS Sink are in the attached state:
 - DTS Source adjusts both [Rp](#) values as needed for offered current

- TS Sink detects and monitors [vRd](#) on the CC pins for available current on VBUS and performs any orientation required
- DTS Source monitors both CC pins for detach and when detected on either pin, enters [UnattachedDeb.SRC](#)
- TS Sink monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

B.2.5.1.2 DTS Source to TS DRP Behavior

The following describes the behavior when a DTS Source is connected to a TS DRP.

1. DTS Source and TS DRP in the unattached state
 - TS DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DTS Source transitions from [UnattachedDeb.SRC](#) to [AttachedDeb.SRC](#) through [AttachWaitDeb.SRC](#)
 - DTS Source detects the TS DRP's pull-downs on both CC pins and enters [AttachWaitDeb.SRC](#). After [tCCDebounce](#) it then enters [AttachedDeb.SRC](#)
 - ~~DTS Source turns on VBUS~~
 - DTS Source turns on VBUS
3. TS DRP transitions from [Unattached.SNK](#) to [DebugAccessory.SNK](#) through [AttachWait.SNK](#)
 - TS DRP in [Unattached.SNK](#) detects the DTS Source's pull-ups on both CC pins and enters [AttachWait.SNK](#). After that state persists for [tCCDebounce](#) and it detects VBUS, it enters [DebugAccessory.SNK](#)
4. While the DTS Source and TS DRP are in their respective attached states:
 - DTS Source adjusts both [Rp](#) values as needed for offered current
 - TS DRP detects and monitors [vRd](#) on both CC pins for available current on VBUS and performs any orientation required
 - DTS Source monitors both CC pins for detach and when detected, enters [UnattachedDeb.SRC](#)
 - TS DRP monitors VBUS for detach and when detected, enters [Unattached.SNK](#) (and resumes toggling between [Unattached.SNK](#) and [Unattached.SRC](#))

B.2.5.1.3 DTS Sink to TS Source Behavior

The following describes the behavior when a DTS Sink is connected to a TS Source.

1. TS Source and DTS Sink in the unattached state
2. TS Source transitions from [Unattached.SRC](#) to [UnorientedDebugAccessory.SRC](#) through [AttachWait.SRC](#)
 - TS Source detects the DTS Sink's pull-downs on both CC pins and enters [AttachWait.SRC](#). After [tCCDebounce](#), it enters [UnorientedDebugAccessory.SRC](#).
 - TS Source turns on VBUS
3. DTS Sink transitions from [UnattachedDeb.SNK](#) to [AttachedDeb.SNK](#) through [AttachWaitDeb.SNK](#).
 - DTS Sink in [UnattachedDeb.SNK](#) detects the TS Source's pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#).
 - DTS Sink in [AttachWaitDeb.SNK](#) detects that the pull-ups on both CC pins persist for [tCCDebounce](#) and it detects VBUS. It enters [AttachedDeb.SNK](#)

- DTS sink determines advertised current from [vRd](#) on either CC pin.
- 4. If orientation supported, DTS Sink adjusts [Rd](#) on the non-CC communication pin as needed for orientation detection.
- 5. If orientation supported, TS Source detects change in [vRd](#) of one of the CC pins and transitions from [UnorientedDebugAccessory.SRC](#) to [OrientedDebugAccessory.SRC](#) and performs any orientation required.
- 6. While the TS Source and DTS Sink are in the attached state:
 - If orientation is supported, DTS sink determines any change in advertised current from [vRd](#) of the CC pin that has been set as the CC communication pin.
 - TS Source monitors both CC pins for detach and when detected, enters [Unattached.SRC](#)
 - DTS Sink monitors VBUS for detach and when detected, enters [UnattachedDeb.SNK](#)

B.2.5.1.4 DTS Sink to TS DRP Behavior

The following describes the behavior when a DTS Sink is connected to a TS DRP.

1. DTS Sink and TS DRP in the unattached state
 - TS DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
2. TS DRP transitions from [Unattached.SRC](#) to [UnorientedDebugAccessory.SRC](#) through [AttachWait.SRC](#)
 - TS DRP in [Unattached.SRC](#) detects both CC pull-downs of DTS Sink in [UnattachedDeb.SNK](#) and enters [AttachWait.SRC](#)
 - TS DRP in [AttachWait.SRC](#) detects that the pull-downs on both CC pins persist for [tCCDebounce](#). It then enters [UnorientedDebugAccessory.SRC](#) and turns on VBUS
3. DTS Sink transitions from [UnattachedDeb.SNK](#) to [AttachedDeb.SNK](#) through [AttachWaitDeb.SNK](#).
 - DTS Sink in [UnattachedDeb.SNK](#) detects the TS DRP's pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#). After that state persists for [tCCDebounce](#) and it detects VBUS, it enters [AttachedDeb.SNK](#)
 - DTS sink determines advertised current from [vRd](#) on either CC pin.
7. If orientation is supported, DTS Sink adjusts [Rd](#) on the non-CC communication pin as needed for orientation detection.
8. If orientation supported, TS DRP detects change in [vRd](#) on one of the CC pins and transitions to [OrientedDebugAccessory.SRC](#) and performs the required orientation.
9. While the TS DRP and DTS Sink are in the attached state:
 - If orientation is supported, DTS sink determines any change in advertised current from [vRd](#) of the CC pin that has been set as the CC communication pin.
 - TS DRP monitors both CC pins for detach and when detected, enters [Unattached.SNK](#)
 - DTS Sink monitors VBUS for detach and when detected, enters [UnattachedDeb.SNK](#)

B.2.5.1.5 DTS DRP to TS Sink Behavior

The following describes the behavior when a DTS DRP is connected to a TS Sink.

1. DTS DRP and TS Sink in the unattached state
 - DTS DRP alternates between [UnattachedDeb.SRC](#) and [UnattachedDeb.SNK](#)
2. DTS DRP transitions from [UnattachedDeb.SRC](#) to [AttachedDeb.SRC](#) through [AttachWaitDeb.SRC](#)
 - DTS DRP in [UnattachedDeb.SRC](#) detects both of the CC pull-downs of TS Sink enters [AttachWaitDeb.SRC](#)
 - DTS DRP in [AttachWaitDeb.SRC](#) detects that the pull-downs on both CC pins persist for [tCCDebounce](#). It then enters [AttachedDeb.SRC](#)
 - DTS DRP turns on VBUS
3. TS Sink transitions from [Unattached.SNK](#) to [DebugAccessory.SNK](#) through [AttachWait.SNK](#)
 - TS Sink in [Unattached.SNK](#) detects the DTS DRP's pull-ups on both CC pins and enters [AttachWait.SNK](#)
 - TS Sink in [AttachWait.SNK](#) detects that the pull-ups on both CC pins persist for [tCCDebounce](#) and it detects VBUS. It enters [DebugAccessory.SNK](#)
4. While the DTS DRP and TS Sink are in their respective attached states:
 - DTS DRP adjusts [Rp](#) as needed for offered current
 - TS Sink detects and monitors [vRd](#) on the CC pins for available current on VBUS and performs any orientation required
 - DTS DRP monitors both CC pins for detach and when detected, enters [UnattachedDeb.SNK](#)
 - TS Sink monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

B.2.5.1.6 DTS DRP to TS DRP Behavior

The following describes the behavior when a DTS DRP is connected to TS DRP.

Case #1:

1. Both DRPs in the unattached state
 - DTS DRP alternates between [UnattachedDeb.SRC](#) and [UnattachedDeb.SNK](#)
 - TS DRP alternate between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DTS DRP transitions from [UnattachedDeb.SRC](#) to [AttachWaitDeb.SRC](#)
 - DTS DRP in [UnattachedDeb.SRC](#) detects both CC pull-downs of TS DRP in [Unattached.SNK](#) and enters [AttachWaitDeb.SRC](#)
3. TS DRP transitions from [Unattached.SNK](#) to [AttachWait.SNK](#)
 - TS DRP in [Unattached.SNK](#) detects both CC pull-ups of DTS DRP and enters [AttachWait.SNK](#)
4. DTS DRP transitions from [AttachWaitDeb.SRC](#) to [AttachedDeb.SRC](#)
 - DTS DRP in [AttachWaitDeb.SRC](#) continues to see both CC pull-downs of TS DRP for [tCCDebounce](#), enters [AttachedDeb.SRC](#) and turns on VBUS
5. TS DRP transitions from [AttachWait.SNK](#) to [DebugAccessory.SNK](#)
 - TS DRP detects DTS DRP's pull-ups on both CC pins for [tCCDebounce](#) and detects VBUS and enters [DebugAccessory.SNK](#)
 - TS DRP detects and monitors [vRd](#) on the CC pins for available current on VBUS and performs any orientation required

6. While the TS DRP and DTS DRP are in the attached state:
 - TS DRP monitors VBUS for detach and when detected, enters [Unattached.SNK](#)
 - DTS DRP monitors both CC pins for detach and when detected, enters [UnattachedDeb.SNK](#)

Case #2:

1. Both DRPs in the unattached state
 - DTS DRP alternates between [UnattachedDeb.SRC](#) and [UnattachedDeb.SNK](#)
 - TS DRP alternate between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DTS DRP transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#)
 - DTS DRP in [UnattachedDeb.SNK](#) detects both CC pull-ups of TS DRP in [Unattached.SRC](#) and enters [AttachWaitDeb.SNK](#)
3. TS DRP transitions from [Unattached.SRC](#) to [UnorientedDebugAccessory.SRC](#) through [AttachWait.SRC](#)
 - TS DRP in [Unattached.SRC](#) detects both CC pull-downs of DTS DRP and enters [AttachWait.SRC](#)
 - TS DRP in [AttachWait.SRC](#) continues to see both CC pull-downs of TS DRP for [tCCDebounce](#), enters [UnorientedDebugAccessory.SRC](#) and turns on VBUS
4. DTS DRP transitions from [AttachWaitDeb.SNK](#) to [TryDeb.SRC](#)
 - DTS DRP in [AttachWaitDeb.SNK](#) continues to see both CC pull-ups of TS DRP for [tCCDebounce](#) and detects VBUS, enters [TryDeb.SRC](#)
5. TS DRP transitions from [UnorientedDebugAccessory.SRC](#) to [Unattached.SNK](#)
 - TS DRP in [UnorientedDebugAccessory.SRC](#) detects the removal of both CC pull-downs of DTS DRP and enters [Unattached.SNK](#)
6. TS DRP transitions from [Unattached.SNK](#) to [AttachWait.SNK](#)
 - TS DRP in [Unattached.SNK](#) detects both CC pull-ups of DTS DRP and enters [AttachWait.SNK](#)
7. DTS DRP transitions from [TryDeb.SRC](#) to [AttachedDeb.SRC](#)
 - DTS DRP in [TryDeb.SRC](#) detects both CC pull-downs of TS DRP for [tTryCCDebounce](#) and enters [AttachedDeb.SRC](#)
 - DTS DRP turns on VBUS
8. TS DRP transitions from [AttachWait.SNK](#) to [DebugAccessory.SNK](#)
 - TS DRP detects DTS DRP's pull-ups on both CC pins for [tCCDebounce](#) and detects VBUS and enters [DebugAccessory.SNK](#)
9. While the DTS DRP and TS DRP are in their respective attached states:
 - DTS DRP adjusts [Rp](#) as needed for offered current
 - TS DRP detects and monitors [vRd](#) on the CC pins for available current on VBUS and performs any orientation required
 - DTS DRP monitors both CC pins for detach and when detected, enters [UnattachedDeb.SNK](#)
 - TS DRP monitors VBUS for detach and when detected, enters [Unattached.SNK](#)

B.2.5.1.7 DTS DRP to TS Source Behavior

The following describes the behavior when a DTS DRP is connected to TS Source.

1. DTS DRP and TS Source in the unattached state
 - DTS DRP alternates between [UnattachedDeb.SRC](#) and [UnattachedDeb.SNK](#)
 - TS Source in [Unattached.SRC](#)
2. DTS DRP transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#)
 - DTS DRP in [UnattachedDeb.SNK](#) detects pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#)
3. TS Source transitions from [Unattached.SRC](#) to [UnorientedDebugAccessory.SRC](#) through [AttachWait.SRC](#)
 - TS Source in [Unattached.SRC](#) detects both CC pull-downs of DTS DRP and enters [AttachWait.SRC](#)
 - TS Source in [AttachWait.SRC](#) continues to see both CC pull-downs of DTS DRP for [tCCDebounce](#), enters [UnorientedDebugAccessory.SRC](#) and turns on VBUS
4. DTS DRP transitions from [AttachWaitDeb.SNK](#) to [TryDeb.SRC](#)
 - DTS DRP in [AttachWaitDeb.SNK](#) continues to see both CC pull-ups of TS DRP for [tCCDebounce](#) and detects VBUS, enters [TryDeb.SRC](#)
5. TS Source transitions from [UnorientedDebugAccessory.SRC](#) to [Unattached.SRC](#)
 - TS Source in [UnorientedDebugAccessory.SRC](#) detects the removal of both CC pull-downs of DTS DRP and enters [Unattached.SRC](#)
6. DTS DRP transitions from [TryDeb.SRC](#) to [TryWaitDeb.SNK](#)
 - After [tDRPTry](#), DTS DRP does not see pull-downs on both CC pin and enters [TryWaitDeb.SNK](#)
7. TS Source transitions from [Unattached.SRC](#) to [UnorientedDebugAccessory.SRC](#)
 - TS Source in [Unattached.SRC](#) detects pull-downs on both CC pins and enters [AttachWait.SRC](#)
 - TS Source continues to detect pull-downs on both CC pins for [tCCDebounce](#) and enters [UnorientedDebugAccessory.SRC](#) and outputs VBUS
8. DTS DRP transitions from [TryWaitDeb.SNK](#) to [AttachedDeb.SNK](#)
 - DTS DRP sees pull-ups on both CC pins for [tCCDebounce](#) and detects VBUS and enters [AttachedDeb.SNK](#)
 - If orientation required, DTS DRP adjusts [Rd](#) on the non-CC communication pin as needed for orientation detection
9. If orientation supported, TS Source detects change in [vRd](#) on one of the CC pins and transitions to [OrientedDebugAccessory.SRC](#) and performs the required orientation.
10. While the TS Source and DTS DRP are in the attached state:
 - If orientation is supported, DTS DRP determines any change in advertised current from [vRd](#) of the CC pin that has been set as the CC communication pin.
 - TS Source monitors both CC pins for detach and when detected, enters [Unattached.SRC](#)
 - DTS DRP monitors VBUS for detach and when detected, enters [UnattachedDeb.SNK](#)

B.2.5.2 DTS Port to non-DAM TS Port Interoperability Behaviors

The following sub-sections describe the non-functional port-to-port interoperability behaviors for the various combinations of DTS and TS Sources, Sinks, and DRPs that do not support DAM.

B.2.5.2.1 DTS Source to non-DAM TS Sink Behavior

The following describes the behavior when a DTS Source is connected to a non-DAM TS Sink.

1. DTS Source and TS Sink in the unattached state
2. DTS Source transitions from [UnattachedDeb.SRC](#) to [AttachedDeb.SRC](#) through [AttachWaitDeb.SRC](#)
 - DTS Source detects the non-DAM TS Sink's pull-downs on both CC pins and enters [AttachWaitDeb.SRC](#). After [tCCDebounce](#) it then enters [AttachedDeb.SRC](#)
 - [DTS Source turns on VBUS](#)
 - [DTS Source turns on VBUS](#)
3. Non-DAM TS Sink transitions from [Unattached.SNK](#) to [AttachWait.SNK](#).
 - Non-DAM TS Sink in [Unattached.SNK](#) detects the DTS Source's pull-ups on both CC pins and enters [AttachWait.SNK](#).
 - Non-DAM TS Sink continues to detect pull-ups on both CC pins and stays in [AttachWait.SNK](#) because it does not support DAM (will not enter [Attached.SNK](#) because it does not detect [SNK.Open](#) on either pin)
4. While the DTS Source and non-DAM TS Sink are in their final state:
 - DTS Source adjusts [Rp](#) as needed for offered current
 - Non-DAM TS Sink may draw USB default current from DTS Source as permitted by Section 4.5.2.2 but will not enter DAM
 - DTS Source monitors both CC pins for detach and when detected, enters [UnattachedDeb.SRC](#)
 - Non-DAM TS Sink monitors both CC pins for detach and when detected, enters [Unattached.SNK](#)

B.2.5.2.2 DTS Source to non-DAM TS DRP Behavior

The following describes the behavior when a DTS Source is connected to a non-DAM TS DRP.

1. DTS Source and non-DAM TS DRP in the unattached state
 - Non-DAM TS DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
2. DTS Source transitions from [UnattachedDeb.SRC](#) to [AttachedDeb.SRC](#) through [AttachWaitDeb.SRC](#)
 - DTS Source detects the non-DAM TS Sink's pull-downs on both CC pins and enters [AttachWaitDeb.SRC](#). After [tCCDebounce](#) it then enters [AttachedDeb.SRC](#)
 - [DTS Source turns on VBUS](#)
 - [DTS Source turns on VBUS](#)
3. Non-DAM TS DRP transitions from [Unattached.SNK](#) to [AttachWait.SNK](#).
 - Non-DAM TS DRP in [Unattached.SNK](#) detects the DTS Source's pull-ups on both CC pins and enters [AttachWait.SNK](#).

- Non-DAM TS DRP continues to detect pull-downs on both CC pins and stays in [AttachWait.SNK](#) because it does not support DAM (will not enter [Attached.SNK](#) because it does not detect [SNK.Open](#) on either pin)
4. While the DTS Source and non-DAM TS DRP are in their final state:
 - DTS Source adjusts [Rp](#) as needed for offered current
 - Non-DAM TS DRP may draw USB default current from DTS Source as permitted by Section 4.5.2.2 but will not enter DAM
 - DTS Source monitors both CC pins for detach and when detected, enters [UnattachedDeb.SRC](#)
 - Non-DAM TS DRP monitors both CC pins for detach and when detected, enters [Unattached.SRC](#)

B.2.5.2.3 DTS Sink to non-DAM TS Source Behavior

The following describes the behavior when a DTS Sink is connected to a non-DAM TS Source.

1. Non-DAM TS Source and DTS Sink in the unattached state
2. Non-DAM TS Source transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - Non-DAM TS Source detects the DTS Sink's pull-downs on both CC pins and enters [AttachWait.SRC](#).
 - Non-DAM TS Source continues to detect pull-downs on both CC pins and stays in [AttachWait.SRC](#) because it does not support DAM (will not enter [Attached.SRC](#) because it does not detect [SRC.Rd](#) on only one CC pin)
3. DTS Sink transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#).
 - DTS Sink in [UnattachedDeb.SNK](#) detects the non-DAM TS Source's pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#)
 - DTS Sink remains in [AttachWaitDeb.SNK](#) because it does not detect VBUS
4. While the non-DAM TS Source and DTS Sink are in their final state:
 - Non-DAM TS Source monitors both CC pins for detach and when detected, enters [Unattached.SRC](#)
 - DTS Sink monitors VBUS for attach and both CC pins for detach and enters [UnattachedDeb.SNK](#) when both CC pins go to [SNK.Open](#)

B.2.5.2.4 DTS Sink to non-DAM TS DRP Behavior

The following describes the behavior when a DTS Sink is connected to a non-DAM TS DRP.

1. DTS Sink and non-DAM TS DRP in the unattached state
 - Non-DAM TS DRP alternates between [Unattached.SRC](#) and [Unattached.SNK](#)
 - DTS Sink in [UnattachedDeb.SNK](#)
2. Non-DAM TS DRP transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - Non-DAM TS DRP detects the DTS Sink's pull-downs on both CC pins and enters [AttachWait.SRC](#).
 - Non-DAM TS DRP continues to detect pull-downs on both CC pins and stays in [AttachWait.SRC](#) because it does not support DAM (will not enter [Attached.SRC](#) because it does not detect [SRC.Rd](#) on only one CC pin)
3. DTS Sink transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#).

- DTS Sink in [UnattachedDeb.SNK](#) detects the non-DAM TS DRP's pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#)
 - DTS Sink remains in [AttachWaitDeb.SNK](#) because it does not detect VBUS
4. While the non-DAM TS DRP and DTS Sink are in their final state:
- Non-DAM TS DRP monitors both CC pins for detach and when detected, enters [Unattached.SNK](#)
 - DTS Sink monitors VBUS for attach and both CC pins for detach and enters [UnattachedDeb.SNK](#) when both CC pin go to [SNK.Open](#)

B.2.5.2.5 DTS DRP to non-DAM TS Sink Behavior

The DTS DRP to non-DAM TS Sink behavior follows the flow in Section B.2.5.2.1.

B.2.5.2.6 DTS DRP to non-DAM TS DRP Behavior

The DTS DRP to non-DAM TS DRP behavior follows the flows in Section B.2.5.2.2 and Section B.2.5.2.4 depending on the role forced by the non-DAM TS DRP

B.2.5.2.7 DTS DRP to non-DAM TS Source Behavior

The following describes the behavior when a DTS DRP is connected to non-DAM TS Source.

1. DTS DRP and non-DAM TS Source in the unattached state
 - DTS DRP alternates between [UnattachedDeb.SRC](#) and [UnattachedDeb.SNK](#)
 - Non-DAM TS Source in [Unattached.SRC](#)
2. DTS DRP transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#)
 - DTS DRP in [UnattachedDeb.SNK](#) detects pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#)
3. Non-DAM TS Source transitions from [Unattached.SRC](#) to [AttachWait.SRC](#)
 - Non-DAM TS Source in [Unattached.SRC](#) detects pull-downs on both CC pins and enters [AttachWait.SRC](#)
 - Non-DAM TS Source continues to detect pull-downs on both CC pins and stays in [AttachWait.SRC](#) because it does not support DAM (will not enter [Attached.SRC](#) because it does not detect [SRC.Rd](#) on only one CC pin)
 - DTS Sink remains in [AttachWaitDeb.SNK](#) because it does not detect VBUS
5. While the non-DAM TS Source and DTS DRP are in their final state:
 - Non-DAM TS Source monitors both CC pins for detach and when detected, enters [Unattached.SRC](#)
 - DTS DRP monitors VBUS for attach and both CC pins for detach and enters [UnattachedDeb.SRC](#) when both CC pin go to [SNK.Open](#)

B.2.5.2.8 DTS Sink to non-DAM TS Sink with Accessory Support Behavior

The following describes the behavior when a DTS Sink is connected to a non-DAM USB Type-C TS Sink with Accessory Support.

1. DTS Sink and non-DAM TS Sink with Accessory Support ("non-DAM TS Sink" for the remainder of this flow) in the unattached state
 - Non-DAM TS Sink alternates between [Unattached.SNK](#) and [Unattached.Accessory](#)

- DTS Sink in [UnattachedDeb.SNK](#)
- 2. Non-DAM TS Sink transitions from [UnattachedAccessory](#) to [AttachWaitAccessory](#)
 - Non-DAM TS Sink detects the DTS Sink's pull-downs on both CC pins and enters [AttachWaitAccessory](#)
 - Non-DAM TS Sink continues to detect pull-downs on both CC pins and enters USB Type-C [Debug Accessory Mode](#)
- 3. DTS Sink transitions from [UnattachedDeb.SNK](#) to [AttachWaitDeb.SNK](#).
 - DTS Sink in [UnattachedDeb.SNK](#) detects the non-DAM TS Sinks pull-ups on both CC pins and enters [AttachWaitDeb.SNK](#)
 - DTS Sink remains in [AttachWaitDeb.SNK](#) because it does not detect VBUS
- 4. While the non-DAM TS DRP and DTS Sink are in their final state:
 - Non-DAM TS Sink monitors both CC pins for detach and when detected, enters [Unattached.SNK](#)
 - DTS Sink monitors both CC pins for detach and enters [UnattachedDeb.SNK](#) when both CC pins go to [SNK.Open](#)

B.2.6 Orientation Detection

Orientation detection is optional normative. A USB Type-C port supporting [Debug Accessory Mode](#) is not required to perform orientation detection. If orientation detection is required, this method shall be followed.

B.2.6.1 Orientation Detection using Rd and/or Rp Values

In this optional normative flow, the DTS shall always initiate an orientation detection sequence, independent of its role as Source, Sink, or DRP. This means that the TS must detect this orientation sequence and perform multiplexing to orient and connect the port signals to the proper channels as well as determine the proper CC pin for [USB-PD](#) communication.

B.2.6.1.1 Orientation Detection with DTS as a Source

When the DTS is presenting an [Rp](#), it shall present asymmetric [Rp](#) values ($Rp1/Rp2$) on CC1/CC2 to indicate orientation to the TS. The DTS as a source shall indicate a weaker resistive value on CC2. Table B-2 shows the values of [Rp](#) resistance on each CC pin to indicate orientation and advertise the USB Type-C current available on VBUS. See Table 4-20 for the [Rp](#) resistance ranges.

Once the TS sink enters the [DebugAccessory.SNK](#) state, after the [vRd](#) on both CC pins is stable for [tRpValueChange](#), it will orient its signal multiplexor based on the detected orientation indicated by the relative voltages of the CC pins. The CC pin with the greater voltage is the plug CC pin, which establishes the orientation of the DTS plug in the TS receptacle and also indicates the [USB-PD](#) CC communication wire. The TS Sink cannot perform [USB-PD](#) communication or connect any orientation-sensitive debug signals until orientation is determined.

B.2.6.1.2 Orientation Detection with DTS as a Sink

When the DTS is a sink, it shall follow a two-step approach.

1. The DTS sink shall present [Rd/Rd](#) on the CC pins of the debug accessory plug. This will put the system into debug accessory mode

2. Once the DTS sink enters [AttachedDeb.SNK](#) state, it shall present a resistance to GND of \leq [Ra](#) on B5 (CC2)

The asymmetric signaling is detected by the TS Source in the [UnorientedDebugAccessory.SRC](#) state. Once Detected, the TS Source will move to the [OrientedDebugAccessory.SRC](#). Once the TS source enters the [OrientedDebugAccessory.SRC](#) state, after the SRC.Ra level is detected on one of the CC pins, it will orient its signal multiplexor based on the detected orientation indicated by the relative voltages of the CC pins. The CC pin with the greater voltage is the plug CC pin, which establishes the orientation of the DTS plug in the TS receptacle and also indicates the [USB-PD](#) CC communication wire. The TS Source cannot perform [USB-PD](#) communication or connect any orientation-sensitive debug signals until orientation is determined.

B.3 Security/Privacy Requirements:

Debug port(s) typically provide system access beyond the normal operation of USB hardware and protocol. Additional protection against unintended use is needed. The design must incorporate appropriate measures to prohibit unauthorized access or modification of the unit under test and to prevent exposure of private user data on the unit under test. The method of protection is not explicitly defined in this specification.

The vendor shall assert as part of USB compliance certification that:

- The device has met the requirement to protect the system's security and user's privacy in its vendor-specific implementation of the port, and
- The device requires the user to take an explicit action to authorize access to or modification of the unit.

C USB Type-C Digital Audio

C.1 Overview

One of the goals of USB Type-C™ is to help reduce the number of I/O connectors on a host platform. One connector type that could be eliminated is the legacy 3.5 mm audio device jack. While USB Type-C does include definition of an analog audio adapter accessory (see Appendix A), that solution requires a separate adapter that can be readily lost and the host implementation in support of analog audio is technically challenging. To best serve the user experience, a simplified USB Type-C digital audio solution based on native USB protocol is simpler/more interoperable with both the host platform and audio device being connected directly without the need for adapters and operates seamlessly through existing USB topologies (e.g. through hubs and docks).

This appendix is for the optional normative definition of digital audio support on USB Type-C-based products. Any USB Audio Class product, having either a USB Type-C plug or receptacle, and whether it is a host system, typically an audio source, and an audio device, typically an audio sink, shall meet the requirements of this appendix in addition to all other applicable USB specification requirements.

C.2 USB Type-C Digital Audio Specifications

USB Type-C Digital Audio (TCDA), when implemented per this specification, shall be compliant with either the USB Audio Device Class 1.0, 2.0 or 3.0 specifications as listed below. While allowed, basing a TCDA on USB Audio Device Class 1.0 is not recommended. Given the number of benefits in terms of audio profile support, simplified enumeration and configuration, and improved low-power operation, use of the USB Audio Device Class 3.0 is strongly recommended.

USB Audio Device Class 1.0 including:

- [USB Device Class Definition for Audio Devices, Release 1.0](#)
- [USB Device Class Definition for Audio Data Formats, Release 1.0](#)
- [USB Device Class Definition for Audio Terminal Types, Release 1.0](#)

USB Audio Device Class 2.0 including:

- [USB Device Class Definition for Audio Devices, Release 2.0](#)
- [USB Device Class Definition for Audio Data Formats, Release 2.0](#)
- [USB Device Class Definition for Audio Terminal Types, Release 2.0](#)

USB Audio Device Class 3.0 including:

- [USB Device Class Definition for Audio Devices, Revision 3.0](#)
- [USB Device Class Definition for Audio Data Formats, Release 3.0](#)
- [USB Device Class Definition for Audio Terminal Types, Release 3.0](#)
- [USB Device Class Definition for Basic Audio Functions, Release 3.0](#)

USB Audio Device Class 3.0 specifications now include the definition of basic audio function profiles (Basic Audio Device Definition, BADD). TCDA devices based on USB Audio Device Class 3.0 will implement one of the defined profiles. TCDA-capable hosts based on USB Audio Device Class 3.0 will recognize and typically implement all of the profiles that are relevant to the capabilities and usage models for the host.

TCDA devices shall fall into one of the following two configurations:

- a traditional VBUS-powered USB device that has a USB Type-C receptacle for use with a standard USB Type-C cable, or
- a VCONN-Powered USB Device (VPD) that has a captive cable with a USB Type-C plug (including thumb drive style products).

USB Type-C plug-based TCDA devices shall not be implemented as a variant of the USB Type-C Analog Audio Adapter Accessory (Appendix A This appendix is reserved for the future definition of the USB Type-C Digital Audio support.).
